Acknowledgments

The Technical Reference Manual is maintained by the Public Utility Commission of Texas' independent evaluation, monitoring and verification (EM&V) team led by Tetra Tech. This version of the Texas Technical Reference Manual was primarily developed from program documentation and measure savings calculators used by the Texas Electric Utilities and their Energy Efficiency Services Providers (EESPs) to support their energy efficiency efforts, and original source material from petitions filed with the Public Utility Commission of Texas by the utilities, their consultants and EESPs such as Frontier Associates (TXu 1-904-705), ICF, CLEAResult and Nexant. Portions of the Technical Reference Manual are copyrighted 2001-2017 by the Electric Utility Marketing Managers of Texas (EUMMOT), while other portions are copyrighted 2001-2018 by Frontier Energy. Certain technical content and updates were added by the EM&V team to provide further explanation and direction as well as consistent structure and level of information.

TRM Technical Support

Technical support and questions can be emailed to the EM&V project manager, Lark.Lee@tetratech.com and the PUCT, Therese.Harris@puc.texas.gov.

1 INTRODUCTION

This volume of the TRM contains the deemed savings for residential measures that have been approved for use in Texas by the Public Utility Commission of Texas (PUCT). This volume includes instructions regarding various savings calculators and reference sources of the information. TRM v6.0 serves as a centralized source of deemed savings values. Where appropriate, Measurement and Verification (M&V) methods by measure category are noted for informational purposes only regarding the basis of projected and claimed savings.

Table 1-1 provides an overview of the residential measures contained within this Program Year (PY) 2018 TRM 6.0 Volume 2 and the types of deemed savings estimates available for each one. There are five types of deemed savings estimates identified:

- *Point estimates* that provided a single deemed savings value correspond to a single measure or type of technology.
- *Deemed saving tables* that provide energy and peak savings as a function of size, capacity, building type, efficiency level, or other inputs.
- *Savings algorithms* that require specified primary inputs that must be gathered on site and the identification of default inputs where primary data could not be collected. In many cases, these algorithms are provided as references to deemed savings tables, point estimates, or calculator explanations.
- *Calculators* are used by different utilities and implementers to calculate energy savings for different measures. In many cases, there are several different calculators available for a single measure. Sometimes their background calculators are similar, and in other cases, estimates can vary greatly between each calculator.
- *M&V* methods are also used for some measures to calculate savings in the event that standard equipment is not used, or the specified building types do not apply. For some of these measures, both a simplified M&V approach and a full M&V approach may be allowed by the utility. M&V methods as a source of claimed and projected savings are noted for informational purposes only.

Table 1-1: Residential Deemed Savings by Measure Category

Measure Category	Measure Description	Point Estimates	Deemed Savings Tables	Savings Algorithm	Calculator	M&V	6.0 Update
Lighting	Standard compact fluorescent lamps	–	–	X	–	–	Updated useful life estimates and interactive effects factors.
	Specialty compact fluorescent lamps	–	–	X	–	–	Updated useful life estimates and interactive effects factors.

2 RESIDENTIAL MEASURES

2.1 RESIDENTIAL: LIGHTING

2.1.1 Standard Compact Fluorescent Lamps Measure Overview

TRM Measure ID: R-LT-CF

Market Sector: Residential

Measure Category: Lighting

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive and direct install

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure provides a method for calculating savings for replacement of an incandescent lamp with a standard CFL in residential applications.

A standard lamp is also called a general service lamp. General service lamps are omnidirectional bulbs that are A, BT, P, PS, S, or T shape bulbs (as defined by the ANSI Standard Lamp Shapes). These lamps are not globe, bullet, candle, flood, reflector, or decorative-shaped (B, BA, C, CA, DC, F, G, R, BR, ER, MR, MRX, or PAR shapes). These bulbs do encompass both twist/spiral and A-lamp shaped CFLs.

Please see www.lightingfacts.com/Library/Content/EISA for more information on general service lamps and CFLs.

Eligibility Criteria

Customer eligibility to be awarded these deemed savings is at the discretion of the utility for different program and customer types. See program-specific manuals to determine customer eligibility.

These savings values rely on usage patterns specific to indoor applications, and therefore should not be applied to outdoor lighting. However, this should not be construed to restrict upstream lighting programs, through which customers purchase efficient lighting products in-store. Future versions of this document may provide savings specific to outdoor and/or upstream applications.

Baseline Condition

The baseline is assumed to be the Energy Independence and Security Act of 2007 (EISA)-mandated maximum wattage for a general service or standard incandescent or halogen lamp (see Table 2-1). Baseline wattages should be adjusted as EISA regulations dictate higher efficiency standards. The second tier of EISA 2007 (EISA Tier 2) regulation goes into effect beginning January 2020. At that time, general service lamps must comply with a 45 lumen-per-watt efficacy standard. However, due to expected lamp replacement schedules, as well as retailer sell-through of existing lighting stock, the 1st Tier EISA baseline will be retained until 2021 when the 2nd Tier EISA baseline will be applied.[1] Nevertheless, incentivized lamps installed in 2020 will be awarded savings against the 2nd Tier EISA baseline since this will be the standard in effect at the time of installation.

Table 2-1: ENERGY STAR® Standard CFLs—EISA Baselines[2]

Minimum Lumens	Maximum Lumens	Incandescent Equivalent Wattage Pre-EISA 2007	1st Tier EISA 2007 (W_{Base})	2nd Tier EISA 2007 (W_{Base}) [3]	Effective Dates For 2nd Tier EISA 2007 Standards*
310	749	40	29	12	1/1/2020
750	1,049	60	43	20	1/1/2020
1,050	1,489	75	53	28	1/1/2020
1,490	2,600	100	72	45	1/1/2020

*While 2nd Tier EISA standards are effective beginning in 2020, 1st Tier EISA baselines will be used until 2021.

[1] This is consistent with the one-year lag applied in the Arkansas TRM Version 4.0 to new standards effective before July 1 of a given year. Arkansas Technical Reference Manual, Version 4.0. Prepared for the Arkansas Public Service Commission. Approved in Docket 10-100-R. Section II – Protocol E. Page 48. http://www.apscservices.info/EEInfo/TRM4.pdf.

[2] In new ENERGY STAR® lighting standards effective September 2014, lumen bins associated with incandescent wattages have been assigned that do not align with those set out in EISA 2007. Due to the likelihood of continuing sell-through of existing ENERGY STAR® lighting and the on-going use of the EISA bin definitions, this TRM maintains the EISA lumen bins for assigning baseline wattage. Future iterations of the Texas TRM, however, may incorporate these new ENERGY STAR® lumen bins for baseline wattage estimates.

[3] Wattages developed using the 45 lumens-per-watt standard for the midpoint of the provided lumen range.

High-Efficiency Condition

New CFLs must be standard (general service) ENERGY STAR® -qualified CFLs as outlined in the latest ENERGY STAR® specification.[4] These CFLs are designed to replace incandescent lamps of the following ANSI Standard Lamp Shape: A, BT, P, PS, S and T.[5] These lamps have medium screw or pin bases, are designed for light output between 310 and 2600 lumens, and are capable of operating at a voltage range at least partially within 110 and 130 volts.[6]

See the ENERGY STAR® website for more information on the specification in effect: http://www.energystar.gov/products/certified-products/detail/light-bulbs.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Wattage reduction is defined as the difference between the wattage of a standard baseline lamp according to EISA 2007 (see Table 2-1) and the wattage of a comparable CFL. A CFL is considered comparable to the baseline lamp if they are aligned on the lumen output ranges set out in EISA 2007.

Energy Savings

Annual energy (kWh) and summer peak demand (kW) savings must be calculated separately for two time periods:

1. First Tier EISA Baseline = 2021 – installation year
2. The remaining time in the EUL period

For the first tier EISA baseline period:

$$\Delta kWh = \frac{\left(W_{base,FT} - W_{post}\right)}{1000} \times HOU \times ISR \times IEF_E$$

Equation 1

For The remaining time in the EUL period., use the second tier EISA baseline:

$$\Delta kWh = \frac{\left(W_{base,ST} - W_{post}\right)}{1000} \times HOU \times ISR \times IEF_E$$

Equation 2

4 http://www.energystar.gov/products/certified-products/detail/light-bulbs.

5 https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V1%201_Specification.pdf.

6 http://lightingfacts.com/Library/Content/EISA.

Annual energy (kWh) savings are calculated by weighting the EISA first and second tier savings by the EISA first tier period and the remainder of the EUL period, as outlined in the Volume 3 appendices.[7]

Where:

$W_{base,FT}$ = *First-tier EISA baseline wattage corresponding with the lumen output of the purchased CFL lamp for the year purchased/installed. First tier EISA baseline lamp wattage provided in Table 2-1 under the column "Incandescent Equivalent 1st Tier EISA 2007" (if unknown, see Table 2-2 for 1st Tier EISA 2007default wattages)*

Table 2-2: ENERGY STAR® Standard CFLs—Default Equivalent Wattages if Lumen Output Unknown

Wattage Range of Installed CFL[8]	7–10 W	9–14 W	18–20 W	15–26 W
If Unknown: Default Installed CFL Wattage[9]	9 W	13 W	19 W	24 W
1st Tier EISA 2007 Default Baseline	29 W	43 W	53 W	72 W
2nd Tier EISA 2007 Default Baseline	12 W	20 W	28 W	45 W

$W_{base,ST}$ = *Second-tier EISA baseline wattage corresponding with the lumen output of the purchased CFL lamp for the year purchased/installed. Second tier EISA baseline lamp wattage provided in Table 2-1 under the column "Incandescent Equivalent 2nd Tier EISA 2007" (if unknown, see Table 2-2 for 2nd Tier EISA 2007default wattages)*

W_{post} = *Actual wattage of CFL purchased/installed*

HOU = *Average hours of use per year = 803 hours (calculated based on an average daily usage of 2.2 hours per day[10])*

IEF_E = *Interactive Effects Factor to account for cooling energy savings and heating energy penalties associated with lighting power reductions (see Table 2-3)*

[7] While this appendix addresses early retirement installations, it is applicable to scenarios in which the baseline changes over the lifetime of the measure. For the purposes of this appendix, savings claimed against the Tier 1 EISA baseline may be treated as early retirement savings, and savings claimed against the Tier 2 EISA baseline may be treated as replace-on-burnout savings.

[8] Wattage ranges from ENERGY STAR® light bulb savings calculator. Updated October 2016. Accessed December 22, 2016. http://www.energystar.gov/products/certified-products/detail/light-bulbs.

[9] ENERGY STAR® Certified Light Bulbs. https://www.energystar.gov/productfinder/download/certified-light-bulbs/. Accessed December 22, 2016. Mean wattages of omnidirectional, general purpose replacement CFL lamps by incandescent wattage equivalent.

[10] The average daily usage of 2.2 hours per day is a blended value for indoor and outdoor lamps. Source: Evaluation of 2008 Texas 'Make Your Mark' Statewide CFL Program Report. Frontier Associates. June 2009.

ISR = *In-Service Rate, the percentage of incentivized units that are installed and in use (rather than removed, stored, or burnt out) to account for units incentivized but not operating = 0.97*[11]

Table 2-3: ENERGY STAR® Standard CFLs—Interactive Effects Factor for Cooling Energy Savings and Heating Energy Penalties[12]

IEF_E					
Heating/Cooling Type*	**Climate Zone 1**	**Climate Zone 2**	**Climate Zone 3**	**Climate Zone 4**	**Climate Zone 5**
Gas heat with AC	1.06	1.13	1.17	1.15	1.12
Gas Heat with no AC	1.00	1.00	1.00	1.00	1.00
Heat Pump	0.91	1.00	1.05	1.11	0.97
Electric Resistance Heat with AC	0.65	0.80	0.90	1.00	0.75
Electric Resistance Heat with no AC	0.57	0.69	0.76	0.83	0.65
No heat with AC	1.06	1.13	1.17	1.15	1.12
Unconditioned Space	1.00	1.00	1.00	1.00	1.00
Heating/Cooling Unknown[13,14]	0.88	0.98	1.04	1.07	0.95

* IEF for homes with no AC are most appropriate for customers with evaporative cooling or room air conditioners.

Demand Savings

Summer and winter demand savings are determined by applying a coincidence factor associated with each season. Annual summer or winter peak demand (kW) savings must be calculated separately for two time periods:

1. First Tier EISA Baseline = 2021-installation year
2. The remaining time in the EUL period

[11] Dimetrosky, S., Parkinson, K. and Lieb, N.,"Residential Lighting Evaluation Protocol – The Uniform Methods Project: Methods for Determining Energy Efficiency Savings for Specific Measures." January 2015. ISR for upstream programs, including storage lamps installed within four years of purchase. http://energy.gov/sites/prod/files/2015/02/f19/UMPChapter21-residential-lighting-evaluation-protocol.pdf.

[12] Extracted from BEopt energy models used to estimate savings for envelope measures. Referencing the EISA baseline table, the typical lumen output was determined by taking the midpoint for the 60 watt equivalent lamp (900 lm), which was assumed to be the most typical installation. The resulting lumens were divided by the default wattage for incandescents (43 W), CFLs (13 W), and LEDs (10 W) resulting in an assumed efficacy for incandescents (21 lm/W), CFLs (70 lm/W), and LEDs (90 lm/W). IEF values were calculated using the following formula: $1 + HVAC_{savings}/Lighting_{savings}$.

[13] Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

[14] Also applies to upstream lighting.

For the first tier EISA baseline period:

$$\Delta kW summer = \frac{(W_{base,FT} - W_{post})}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

Equation 3

$$\Delta kW_{winter} = \frac{(W_{base,FT} - W_{post})}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

Equation 4

For The remaining time in the EUL period., use the second tier EISA baseline:

$$\Delta kW_{summer} = \frac{(W_{base,ST} - W_{post})}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

Equation 5

$$\Delta kW_{winter} = \frac{(W_{base,ST} - W_{post})}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

Equation 6

Annual summer or winter peak demand savings are calculated by weighting the EISA first and second tier savings by the EISA first tier period and the remainder of the EUL period, as outlined in the Volume 3 appendices.[15]

Where:

CF = *Coincidence Factor (see Table 2-4)*

IEF_D = *Interactive Effects Factor to account for cooling demand savings or heating demand penalties associated with lighting power reductions (see Table 2-5)*

Table 2-4: ENERGY STAR® Standard CFLs—Coincidence Factors[16]

Season	Climate Zone 1: Amarillo	Climate Zone 2: Dallas	Climate Zone 3: Houston	Climate Zone 4: Corpus Christi	Climate Zone 5: El Paso
Summer	0.060	0.053	0.063	0.059	0.032
Winter	0.277	0.232	0.199	0.267	0.357

[15] While this appendix addresses early retirement installations, it is applicable to scenarios in which the baseline changes over the lifetime of the measure. For the purposes of this appendix, savings claimed against the Tier 1 EISA baseline may be treated as early retirement savings, and savings claimed against the Tier 2 EISA baseline may be treated as replace-on-burnout savings.

[16] See Volume 1, Appendix B.

Table 2-5: ENERGY STAR® Standard CFLs—Interactive Effects Factor for Cooling Demand Savings and Heating Demand Penalties[17]

$IEF_{D,summer}$

Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The average measure life is based upon rated lamp life of the CFL. The measure life assumes an average use of 2.2 hours per day based on blended usage for indoor/outdoor applications and applies a 0.85 degradation factor to indoor/outdoor CFLs. The algorithms below are designed to provide EISA Tier 1 and EISA Tier 2 measure lives, each to be applied to the appropriate tier of EISA savings.

$$EUL_{Total} = \frac{Rated\ Life \times DF}{HOU \times 365.25}$$

Equation 7

$$EUL_{Tier1} = 2021 - Purchase\ Year$$

Equation 8

$$EUL_{Tier2} = EUL_{Total} - EUL_{Tier1}$$

Equation 9

Where:

$Rated\ Life$	=	*10,000 hours, 12,000 hours, 15,000 hours, or 20,000 hours, as specified by the manufacturer. If unknown, assume a 10,000-hour lifetime.*[22]
DF	=	*0.85 degradation factor*[23]
HOU	=	*2.2 hours per day*[24]
2021	=	*One-year lag applied to year that EISA Tier 1 energy efficiency standard ends*
Purchase year	=	*Current program year*

Table 2-6: ENERGY STAR® Standard CFLs—Estimated Useful Life

Range of Rated Measure Life (Hours)	Assumed Rated Measure Life (Hours)	Total Measure Life (Years)	EISA 1st Tier Standard Baseline Measure Life (Years)	EISA 2nd Tier Measure Life (Years)
10,000–11,000	10,000	11	2	9
11,001–13,500	12,000	13	2	11
13,501–17,500	15,000	16	2	14
≥ 17,501	20,000	20*	2	18

* Measure life capped at 20 years.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Number of CFLs installed
- Wattage of each installed CFL
- Lumen output of each installed CFL
- Manufacturer-rated lifetime of each installed CFL in hours

---

[22] Minimum lifetime requirement under ENERGY STAR® Lamps Specification V1.1, effective September 30, 2014. http://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V1%201_Specification.pdf.

[23] ENERGY STAR® CFL Third Party Testing and Verification Off-the-Shelf CFL Performance: Batch 3. Figure 27, p. 47.

[24] The average daily usage of 2.2 hours per day is a blended value for indoor and outdoor lamps. Source: Evaluation of 2008 Texas 'Make Your Mark' Statewide CFL Program Report. Frontier Associates. June 2009.

- Heating system type (gas, electric resistance, heat pump) for each home in which a CFL is installed
- Location of installed lamp (conditioned, unconditioned, or outdoor)
- Program type (direct install, retail)

Document Revision History

Table 2-7: Residential Compact Fluorescent Lamps Revision History

TRM Version	Date	Description of Change
v1.0	11/25/2013	TRM v1.0 origin.
v2.0	4/18/2014	TRM v2.0 update. Minor corrections due to phase-in of EISA regulations, updated EUL from DEER 2014. Legacy EISA tables removed.
v2.1	1/30/2015	TRM v2.1 update. No revision.
v3.0	4/10/2015	TRM v3.0 update. Introduction of interactive effects factors and in-service rates. Incorporation of Second Tier EISA standards. New peak savings calculated according to revised peak definition. Modified estimation of measure life.
v3.1	11/05/2015	TRM v3.1 update. Modification of in-service rate, revision of interactive effects factors to reflect indoor-specific values for additional heating and cooling equipment types. Provided default input assumptions for upstream lighting programs. Restricted estimated measure life to several discrete values.
v3.1	3/28/2016	TRM v3.1 March revision. Updated summer and winter coincidence factors.
v4.0	10/10/2016	TRM v4.0 update. Updated IEF values and useful life estimates.
v5.0	10/2017	TRM v5.0 update. Updated useful life estimates.
v6.0	11/2018	TRM v6.0 update. Updated useful life estimates. Updated interactive effects factors.

2.1.2 Specialty Compact Fluorescent Lamps Measure Overview

TRM Measure ID: R-LT-SC

Market Sector: Residential

Measure Category: Lighting

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive and direct install

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure provides a method for calculating savings for replacement of a specialty incandescent or halogen lamp with an ENERGY STAR®-qualified specialty CFL in residential applications. These lamps include reflectors, G-shape lamps, T-shape lamps, B, BA, CA, F G16-1/2, G25, G30, S or M14 lamps.

Eligibility Criteria

Customer eligibility to be awarded these deemed savings is at the discretion of the utility for different program and customer types. See program-specific manuals to determine customer eligibility.

These savings values rely on usage patterns specific to indoor applications, and therefore should not be applied to outdoor lighting. However, this should not be construed to restrict upstream lighting programs, through which customers purchase efficient lighting products in-store. Future versions of this document may provide savings specific to outdoor and/or upstream applications.

Baseline Condition

The baseline wattage will be determined based on the bulb shape of the installed lamp as outlined below.

Some baseline conditions for specialty CFLs are affected by EISA and/or a DOE 2009 ruling on incandescent reflector lamps (IRLs). Based on the shape, lumen output, and/or wattage-equivalent of the installed lamp, the appropriate baseline shall be determined from one of the following categories:

- Non-reflector lamps, affected by EISA 2007

- Non-reflector lamps, not affected by EISA 2007
- Reflector lamps affected by the DOE ruling in 2009 on IRLs
- Reflector lamps not affected by the DOE ruling in 2009 on IRLs

Appropriate baseline wattages are presented in Table 2-10 through Table 2-13. If a baseline cannot be determined using these tables, the following guidelines may be used to determine appropriate default baseline wattage:

- Non-Reflector Lamps, affected by EISA 2007: using the exact or range of the installed wattage, determine the appropriate First Tier or Second Tier EISA baseline default wattage in table below

Table 2-8: ENERGY STAR® CFLs—Default Equivalent Wattages if Lumen Output Unknown

Wattage Range of Installed CFL[25]	9–11 W	12–15 W	18–20 W	23–27 W
If Unknown: Default Installed CFL Wattage[26]	9 W	13 W	19 W	24 W
1st Tier EISA 2007 Default Baseline	29 W	43 W	53 W	72 W
2nd Tier EISA 2007 Default Baseline	12 W	20 W	28 W	45 W

- Non-reflector lamps, not affected by EISA 2007: 60 watts[27]
- Reflector lamps affected by the DOE ruling in 2009 on IRLs: 60 watts[28]
- Reflector lamps not affected by the DOE ruling in 2009 on IRLs: the appropriate default baseline may be determined using Table 2-9

[25] Wattage ranges from ENERGY STAR® light bulb savings calculator. Updated October 2016. http://www.energystar.gov/products/certified-products/detail/light-bulbs.

[26] ENERGY STAR® Certified Light Bulbs. https://www.energystar.gov/productfinder/download/certified-light-bulbs/. Accessed October 6, 2015. Mean wattages of omnidirectional, general purpose replacement CFL lamps by incandescent wattage equivalent.

[27] A 2006-2008 California Upstream Lighting Evaluation found an average incandescent wattage of 61.7 Watts (KEMA, Inc., The Cadmus Group, Itron, Inc., PA Consulting Group, Jai J. Mitchell Analytics, Draft Evaluation Report: Upstream Lighting Program. Prepared for the California Public Utilities Commission, Energy Division. December 10, 2009)

[28] Ibid.

Table 2-9: DOE-Ruling Exempt Reflectors—Default Wattages

Lamp Type	W_{Base}
BR30 (65 W)	65 W
BR40 (65 W)	
ER40 (65 W)	
R20 (≤ 45 W)	45 W
BR30 (≤ 50 W)	50 W
BR40 (≤ 50 watt)	
ER30 (≤ 50 watt)	
ER40 (≤ 50 watt)	
Indeterminate	60 W[29]

EISA Standards: Baseline for Non-Reflector Lamps

EISA-Affected

EISA-affected bulbs are:

- G-shape lamps with a diameter less than 5 inches
- T-shape lamps greater than 40 watts or a length of 10 inches or less
- B, BA, CA, F G16-1/2, G25, G30, S or M14 lamps greater than 40 watts.[30]

Baseline wattages should be adjusted as EISA regulations dictate higher efficiency standards. The second tier of EISA 2007 (EISA Tier 2) regulation goes into effect beginning January 2020. However, due to expected lamp replacement schedules, as well as retailer sell-through of existing lighting stock, the 1st Tier EISA baseline will be retained until 2021 when the 2nd Tier EISA baseline will be applied.[31] Nevertheless, incentivized lamps installed in 2020 will be awarded savings against the 2nd Tier EISA baseline since this will be the standard in effect at the time of installation.

[29] Ibid.

[31] This is consistent with the one-year lag applied in the Arkansas TRM Version 4.0 to new standards effective before July 1 of a given year.
Arkansas Technical Reference Manual, Version 4.0. Prepared for the Arkansas Public Service Commission. Approved in Docket 10-100-R. Section II – Protocol E. Page 48. http://www.apscservices.info/EEInfo/TRM4.pdf.

Table 2-10: EISA-Affected Specialty CFL Baselines (Non-Reflectors)[32]

Lamp Type	Minimum Lumens	Maximum Lumens	Incandescent Equivalent 1st Tier EISA 2007 ($W_{Base,FT}$)	Incandescent Equivalent 2nd Tier EISA 2007 ($W_{Base,ST}$) [33]	Effective Dates For 2nd Tier EISA 2007 Standards*
• G-shape lamps with a diameter less than 5 inches • T-shape lamps greater than 40 watts or a length of 10 inches or less • B, BA, CA, F G16-1/2, G25, G30, S or M14 lamps greater than 40 watts	310	749	29	12	1/1/2020
	750	1,049	43	20	1/1/2020
	1,050	1,489	53	28	1/1/2020
	1,490	2,600	72	45	1/1/2020

*While 2nd Tier EISA standards are effective beginning in 2020, 1st Tier EISA baselines will be used until 2021.

EISA-Exempt

EISA-exempt bulbs are:

- Appliance lamps, black light lamps, bug lamps, colored lamps, infrared lamps, left-hand thread lamps, marine lamps, marine signal service lamps, mine service lamps, plant light lamps, reflector lamps, rough service lamps, shatter-resistant lamps, sign service lamps, silver bowl lamps, showcase lamps, 3-way incandescent lamps, and vibration service lamps
- G-shape lamp with a diameter of 5 inches or more
- T-shape lamp of 40 watts or less or a length of more than 10 inches
- B, BA, CA, F, G16-1/2, G25, G30, S or M14 lamp of 40 watts or less[34]

[32] Ibid.
[33] Wattages developed using the 45 lumens-per-watt standard for the midpoint of the provided lumen range.
[34] http://www.lightingfacts.com/Library/Content/EISA.

Table 2-11: EISA-Exempt Specialty CFL Baselines (Non-Reflectors)

Lamp Type	Minimum Lumens	Maximum Lumens	W_{Base}
• Appliance lamps, black light lamps, bug lamps, colored lamps, infrared lamps, left-hand thread lamp, marine lamp, marine signal service lamp, mine service lamp, plant light lamp, reflector lamp, rough service lamp, shatter-resistant lamp, sign service lamp, silver bowl lamp, showcase lamp, 3-way incandescent lamp, vibration service lamp • G-shape lamp with a diameter of 5 inches or more • T-shape lamp of 40 watts or less or a length of more than 10 inches • B, BA, CA, F, G16-1/2, G25, G30, S or M14 lamp of 40 watts or less	Nameplate wattage on the removed product. If unknown, utilities may rely on the rated incandescent wattage equivalent of the newly installed lamp as provided by the manufacturer if available. Otherwise, use 60 watts.[35]		

DOE Standards for Incandescent Reflector Lamps (IRLs): Baseline for Reflector Lamps

DOE Ruling-Affected

Certain types of incandescent reflector bulbs are affected by a DOE 2009 ruling on reflector lamps. Products affected by the IRL ruling are:

- R, PAR, ER, BR, BPAR lamps
- BR and ER lamps rated at more than 50 watts
- Reflector lamps between 2.25" (R18) and 2.75" (R22) in diameter
- 40-205 Watt incandescent PAR lamps[36]

Where available, the nameplate wattage of the removed lamp should be used as the baseline. Otherwise, the baseline wattage can be determined according to the lumen range of the installed lamp (see Table 2-12).

[35] A 2006-2008 California Upstream Lighting Evaluation found an average incandescent wattage of 61.7 Watts (KEMA, Inc., The Cadmus Group, Itron, Inc., PA Consulting Group, Jai J. Mitchell Analytics, Draft Evaluation Report: Upstream Lighting Program. Prepared for the California Public Utilities Commission, Energy Division. December 10, 2009).

	551-600	40
	601-850	50
	851-950	60
	951-1200	75

[37] Wattage values and lumen ranged from a review of GE, Osram Sylvania, and Philips catalogs in January 2015, as well as the Illinois TRM 2014. GE Lighting catalog: http://www.gelighting.com/LightingWeb/na/smartcatalogs/Lighting_and_Ballasts_Section_1_Incandescent_Lamps.pdf Sylvania catalog: http://assets.sylvania.com/assets/documents/complete-catalog.b176dbb1-d6e0-40f0-ab92-e768e58f5dc1.pdf Philips catalog: http://www.usa.lighting.philips.com/connect/tools_literature/downloads/sg100-2013.pdf Illinois TRM 2014: http://www.ilsag.info/technical-reference-manual.html.

[38] Table 2-12 is based on manufacturers' lumen and wattage data for the most commonly used reflector lamps. However, other manufacturers' ratings may differ from this list. Where available, utilities may rely on the rated incandescent wattage equivalent of the newly installed lamp as provided by the manufacturer.

Lamp Type	Lumen Range	W_{Base}
PAR38	550-750	65
	751-1100	75
	1101-1300	100
	1301-1600	120
	1601-2500	150
	2501-3500	175
R20	401-500	50
	501-600	75
	601-1000	100
R30	700-800	75
	801-950	110
	951-1100	125
R40	1300-1900	125

DOE Ruling-Exempt

The DOE 2009 ruling standards do not apply to the following types of IRLs:

- IRLs rated at 50 watts or less that are ER30, BR30, BR40, or ER40 lamps
- IRLs rated at 65 watts that are BR30, BR40, or ER40 lamps
- R20 IRLs rated 45 watts or less[39]

Table 2-13: DOE-Ruling Exempt Reflectors

Lamp Type	W_{Base}
BR30 (65 watt)	Nameplate wattage on the removed product. If unknown, utilities may rely on the rated incandescent wattage equivalent of the newly installed lamp as provided by the manufacturer if available. Otherwise, use 65 watts.
BR40 (65 watt)	
ER40 (65 watt)	
R20 (≤ 45 watt)	Nameplate wattage on the removed product. If unknown, utilities may rely on the rated incandescent wattage equivalent of the newly installed lamp as provided by the manufacturer if available. Otherwise, use 45 watts.
BR30 (≤ 50 watt)	Nameplate wattage on the removed product. If unknown, utilities may rely on the rated incandescent wattage equivalent of the newly installed lamp as provided by the manufacturer if available. Otherwise, use 50 watts.
BR40 (≤ 50 watt)	
ER30 (≤ 50 watt)	
ER40 (≤ 50 watt)	

[39] http://www.gelighting.com/LightingWeb/na/resources/legislation/2009-department-of-energy-regulations/ http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/58.

High-Efficiency Condition

New CFLs must be ENERGY STAR® specialty CFLs as outlined in the latest ENERGY STAR® specification.[40] These lamps include reflectors, G-shape lamps, T-shape lamps, B, BA, CA, F G16-1/2, G25, G30, S or M14 lamps.

These ENERGY STAR® specialty CFLs are the equivalent of the specialty incandescent or halogen lamps being replaced. The high-efficiency condition is the wattage of the lamp installed.

See the ENERGY STAR® website for more information on the specification in effect: http://www.energystar.gov/products/certified-products/detail/light-bulbs.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Wattage reduction is defined as the difference between the wattage of a specialty baseline lamp and the wattage of a comparable CFL.

Energy Savings

For EISA-affected lamps only, annual energy (kWh) savings must be calculated separately for two time periods:

1. First Tier EISA Baseline = 2021 – installation year
2. The remaining time in the EUL period

For the first tier EISA baseline period:

$$\Delta kWh = \frac{\left(W_{base,FT} - W_{post}\right)}{1000} \times HOU \times ISR \times IEF_E$$

Equation 10

For The remaining time in the EUL period., use the second tier EISA baseline:

$$\Delta kWh = \frac{\left(W_{base,ST} - W_{post}\right)}{1000} \times HOU \times ISR \times IEF_E$$

Equation 11

Annual energy (kWh) savings are calculated by weighting the EISA first and second tier savings by the EISA first tier period and the remainder of the EUL period, as outlined in the Volume 3 appendices.[41]

[40] http://www.energystar.gov/products/certified-products/detail/light-bulbs.

[41] While this appendix addresses early retirement installations, it is applicable to scenarios in which the baseline changes over the lifetime of the measure. For the purposes of this appendix, savings claimed against the Tier 1 EISA baseline may be treated as early retirement savings, and savings claimed against the Tier 2 EISA baseline may be treated as replace-on-burnout savings.

For EISA- exempt lamps and reflectors (both DOE ruling-exempt and DOE ruling-affected), annual energy (kWh) savings are not calculated using the two-tiered system. Instead, annual energy (kWh) savings are calculated using one algorithm.

$$\Delta kWh = \frac{(W_{base} - W_{post})}{1000} \times HOU \times ISR \times IEF_E$$

Equation 12

Where:

$W_{base,FT}$ = *First tier EISA baseline wattage corresponding with the lumen output of the purchased CFL lamp for the year purchased/installed. First tier EISA baseline lamp wattage provided in Table 2-10 under the column "Incandescent Equivalent 1st Tier EISA 2007."*

$W_{base,ST}$ = *Second tier EISA baseline wattage corresponding with the lumen output of the purchased CFL lamp for the year purchased/installed. Second tier EISA baseline lamp wattage provided in Table 2-10 under the column "Incandescent Equivalent 2nd Tier EISA 2007."*

W_{base} = *EISA-exempt specialty lamp or a DOE ruling-exempt reflector, use the nameplate wattage (see Table 2-11 and Table 2-13). If a DOE-ruling-affected IRL, use the wattages provided in Table 2-12.*

W_{post} = *Actual wattage of CFL purchased/installed*

HOU = *Average hours of use per year = 803 hours (calculated based on an average daily usage of 2.2 hours per day[42])*

IEF_E = *Interactive Effects Factor to account for cooling energy savings and heating energy penalties associated with lighting power reductions (see Table 2-14)*

ISR = *In-Service Rate, the percentage of incentivized units that are installed and in use (rather than removed, stored, or burnt out) to account for units incentivized but not operating = 0.97* [43]

[42] The average daily usage of 2.2 hours per day is a blended value for indoor and outdoor lamps. Source: Evaluation of 2008 Texas 'Make Your Mark' Statewide CFL Program Report. Frontier Associates. June 2009.

[43] Dimetrosky, S., Parkinson, K., and Lieb, N. "Residential Lighting Evaluation Protocol – The Uniform Methods Project: Methods for Determining Energy Efficiency Savings for Specific Measures." January 2015. ISR for upstream programs, including storage lamps installed within four years of purchase. http://energy.gov/sites/prod/files/2015/02/f19/UMPChapter21-residential-lighting-evaluation-protocol.pdf.

Table 2-14: ENERGY STAR® Specialty CFLs—Interactive Effects Factor for Cooling Energy Savings and Heating Energy Penalties[44]

Heating/Cooling Type*	IEF_E Climate Zone 1	Climate Zone 2	Climate Zone 3	Climate Zone 4	Climate Zone 5
Gas Heat with AC	1.06	1.13	1.17	1.15	1.12
Gas Heat with no AC	1.00	1.00	1.00	1.00	1.00
Heat Pump	0.91	1.00	1.05	1.11	0.97
Electric Resistance Heat with AC	0.65	0.80	0.90	1.00	0.75
Electric Resistance Heat with no AC	0.57	0.69	0.76	0.83	0.65
No heat with AC	1.06	1.13	1.17	1.15	1.12
Unconditioned Space	1.00	1.00	1.00	1.00	1.00
Heating/Cooling Unknown[46,47]	0.88	0.98	1.04	1.07	0.95

* IEF for homes with no AC are most appropriate for customers with evaporative cooling or room air conditioners.

Demand Savings

Summer and winter demand savings are determined by applying a coincidence factor associated with each season. For EISA-affected specialty lamps only, peak demand (kW) savings must be calculated separately for two time periods:

1. First Tier EISA Baseline = 2021-installation year
2. The remaining time in the EUL period

For the first tier EISA baseline period:

$$\Delta kW_{summer} = \frac{\left(W_{base,FT} - W_{post}\right)}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

Equation 13

[44] Extracted from BEopt energy models used to estimate savings for envelope measures. Referencing the EISA baseline table, the typical lumen output was determined by taking the midpoint for the 60 watt equivalent lamp (900 lm), which was assumed to be the most typical installation. The resulting lumens were divided by the default wattage for incandescents (43 W), CFLs (13 W), and LEDs (10 W) resulting in an assumed efficacy for incandescents (21 lm/W), CFLs (70 lm/W), and LEDs (90 lm/W). IEF values were calculated using the following formula: $1 + HVAC_{savings}/Lighting_{savings}$.

[45] Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

[46] Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

[47] Also applies to upstream lighting.

$$\Delta kW_{winter} = \frac{(W_{base,FT} - W_{post})}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

Equation 14

For The remaining time in the EUL period., use the second tier EISA baseline:

$$\Delta kW_{summer} = \frac{(W_{base,ST} - W_{post})}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

Equation 15

$$\Delta kW_{winter} = \frac{(W_{base,ST} - W_{post})}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

Equation 16

Annual summer or winter peak demand savings are calculated by weighting the EISA first and second tier savings by the EISA first tier period and the remainder of the EUL period, as outlined in the Volume 3 appendices.[48]

<u>For EISA- exempt lamps and reflectors (both DOE ruling-exempt and DOE ruling-affected)</u>, peak demand (kW) savings are not calculated using the two-tiered system. Instead, peak demand (kW) savings are calculated using one algorithm, depending on the season of the savings.

$$\Delta kW_{summer} = \frac{(W_{base} - W_{post})}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

Equation 17

$$\Delta kW_{winter} = \frac{(W_{base} - W_{post})}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

Equation 18

Where:

CF	=	*Coincidence Factor (see Table 2-15)*
IEF_D	=	*Interactive Effects Factor to account for cooling demand savings or heating demand penalties associated with lighting power reductions (see Table 2-16)*

[48] While this appendix addresses early retirement installations, it is applicable to scenarios in which the baseline changes over the lifetime of the measure. For the purposes of this appendix, savings claimed against the Tier 1 EISA baseline may be treated as early retirement savings, and savings claimed against the Tier 2 EISA baseline may be treated as replace-on-burnout savings.

Table 2-15: ENERGY STAR® CFLs—Coincidence Factors[49]

Season	Climate Zone 1: Amarillo	Climate Zone 2: Dallas	Climate Zone 3: Houston	Climate Zone 4: Corpus Christi	Climate Zone 5: El Paso
Summer	0.060	0.053	0.063	0.059	0.032

* IEF for homes with no AC are most appropriate for customers with evaporative cooling or room air conditioners.

Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

[53] Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

[54] Also applies to upstream lighting.

Measure Life and Lifetime Savings

The average measure life is based upon rated lamp life of the specialty CFL shown in the following table. The measure life assumes an average daily use of 2.2 hours per day based on blended usage for indoor/outdoor applications and applies a 0.85 degradation factor to indoor/outdoor CFLs.

For an EISA-affected lamp, the following algorithms are designed to provide EISA Tier 1 and EISA Tier 2 measure lives, each to be applied to the appropriate tier of EISA savings.

$$EUL_{Total} = \frac{Rated\ Life \times DF}{HOU \times 365.25}$$

Equation 19

$$EUL_{Tier1} = 2021 - Purchase\ Year$$

Equation 20

$$EUL_{Tier2} = EUL_{Total} - EUL_{Tier1}$$

Equation 21

Where:

$Rated\ Life$	=	*10,000 hours, 12,000 hours, 15,000 hours, or 20,000 hours, as specified by the manufacturer. If unknown, assume a 10,000-hour lifetime.*[55]
DF	=	*0.85 degradation factor*[56]
HOU	=	*2.2 hours per day*[57]
2021	=	*One-year lag applied to year that EISA Tier 1 energy efficiency standard ends*
Purchase year	=	*Current program year*

For EISA-exempt lamps and reflectors (both DOE ruling-exempt and DOE ruling-affected), use the following algorithm to calculate the measure life.

$$EUL = \frac{Rated\ Life \times DF}{HOU \times 365.25}$$

Equation 22

[55] Minimum lifetime requirement under ENERGY STAR® Lamps Specification V1.1, effective 9/30/2014. http://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V1%201_Specification.pdf

Where:

$Rated\ Life$	=	*10,000 hours, 12,000 hours, 15,000 hours, or 20,000 hours, as specified by the manufacturer. If unknown, assume a 10,000-hour lifetime.*[58]
DF	=	*0.85 degradation factor*[59]
HOU	=	*2.2 hours per day*[60]

Table 2-17: ENERGY STAR® Specialty CFLs—Estimated Useful Life

Range of Rated Measure Life (Hours)	Assumed Rated Measure Life (Hours)	Total Measure Life (Years)	If Applicable:	
			EISA 1st Tier Standard Baseline Measure Life (Years)	EISA 2nd Tier Measure Life (Years)
10,000–11,000	10,000	11	2	9
11,001–13,500	12,000	13	2	11
13,501–17,500	15,000	16	2	14
≥ 17,501	20,000	20*	2	18

* Measure life capped at 20 years.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Number of CFLs installed
- ANSI C79.1-2002 nomenclature of CFL installed (G40, PAR, etc.)
- Wattage of each installed CFL
- Lumen output of each installed CFL
- Wattage of replaced lamp
- Manufacturer-rated lifetime of each installed CFL in hours

[58] Minimum lifetime requirement under ENERGY STAR® Lamps Specification V1.1, effective 9/30/2014. http://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V1%201_Specification.pdf.

2.1.3 ENERGY STAR® Omni-Directional LED Lamps Measure Overview

TRM Measure ID: R-LT-OD

Market Sector: Residential

Measure Category: Lighting

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive and direct install

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure provides a method for calculating savings for replacement of an incandescent lamp with an omni-directional LED[61] in a residential application. Using ANSI C79.1-2002 nomenclature, the applicable omni-directional LED lamp types are: A, BT, P, PS, S, and T.

Eligibility Criteria

Customer eligibility to be awarded these deemed savings is at the discretion of the utility for different program and customer types. See program-specific manuals to determine customer eligibility.

These savings values rely on usage patterns specific to indoor applications, and therefore should not be applied to outdoor lighting. However, this should not be construed to restrict upstream lighting programs, through which customers purchase efficient lighting products in-store. Future versions of this document may provide savings specific to outdoor and/or upstream applications.

[61] According to ENERGY STAR® omni-directional LED products "…shall have an even distribution of luminous intensity (candelas) within the 0° to 135° zone (vertically axially symmetrical). Luminous intensity at any angle within this zone shall not differ from the mean luminous intensity for the entire 0° to 135° zone by more than 20 percent. At least 5 percent of total flux (lumens) must be emitted in the 135°-180° zone. Distribution shall be vertically symmetrical as measured in three vertical planes at 0°, 45°, and 90°." http://www.energystar.gov/ia/partners/product_specs/program_reqs/Integral_LED_Lamps_Program_Requirements.pdf.

Baseline Condition

The baseline is assumed to be the EISA-mandated maximum wattage for a general service or standard incandescent or halogen lamp (see Table 2-19). Baseline wattages should be adjusted as EISA regulations dictate higher efficiency baseline lamps. The second tier of EISA 2007 regulations go into effect beginning January 2020. At that time, general service lamps must comply with a 45 lumen per watt efficacy standard. However, due to expected lamp replacement schedules, as well as retailer sell-through of existing lighting stock, the 1st Tier EISA baseline will be retained until 2021 when the 2nd Tier EISA baseline will be applied.[62] Nevertheless, incentivized lamps installed in 2020 will be awarded savings against the 2nd Tier EISA baseline since this will be the standard in effect at the time of installation.

Table 2-19: ENERGY STAR® Omni-Directional LEDs—EISA Baselines[63]

Minimum Lumens	Maximum Lumens	Incandescent Equivalent Wattage Pre-EISA 2007	1st Tier EISA 2007 (W_{Base})	2nd Tier EISA 2007 (W_{Base}) [64]	Effective Dates For 2nd Tier EISA 2007 Standards*
310	749	40	29	12	1/1/2020
750	1,049	60	43	20	1/1/2020
1,050	1,489	75	53	28	1/1/2020
1,490	2,600	100	72	45	1/1/2020

* While 2nd Tier EISA standards are effective beginning in 2020, 1st Tier EISA baselines will be used until 2021.

High-Efficiency Condition

LEDs must be ENERGY STAR® -qualified for the relevant lamp shape being removed as outlined in the latest ENERGY STAR® specification.[65] Using ANSI C79.1-2002 nomenclature, the applicable omni-directional LED lamp types are: A, BT, P, PS, S, and T.

The high-efficiency condition is the wattage of the lamp installed.

See the ENERGY STAR® website for more information on the specification in effect: http://www.energystar.gov/products/certified-products/detail/light-bulbs.

---

62 This is consistent with the one-year lag applied in the Arkansas TRM Version 4.0 to new standards effective before July 1 of a given year. Arkansas Technical Reference Manual, Version 4.0. Prepared for the Arkansas Public Service Commission. Approved in Docket 10-100-R. Section II – Protocol E. Page 48. http://www.apscservices.info/EEInfo/TRM4.pdf.

63 In new ENERGY STAR® lighting standards effective September 2014, lumen bins associated with incandescent wattages have been assigned that do not align with those set out in EISA 2007. Due to the likelihood of continuing sell-through of existing ENERGY STAR® lighting and the on-going use of the EISA bin definitions, this TRM maintains the EISA lumen bins for assigning baseline wattage. Future iterations of the Texas TRM, however, may incorporate these new ENERGY STAR® lumen bins for baseline wattage estimates.

64 Wattages developed using the 45 lumens-per-watt standard for the midpoint of the provided lumen range.

65 http://www.energystar.gov/products/certified-products/detail/light-bulbs.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Wattage reduction is defined as the difference between the wattage of a standard baseline lamp according to EISA 2007 (see Table 2-19) and the wattage of a comparable omni-directional LED. An LED is considered comparable to the baseline lamp if they are aligned on the lumen output ranges set out in EISA 2007.

Energy Savings

Annual energy (kWh) and summer peak demand (kW) savings must be calculated separately for two time periods:

1. First Tier EISA Baseline = 2021 – installation year
2. The remaining time in the EUL period

For the first tier EISA baseline period:

$$\Delta kWh = \frac{\left(W_{base,FT} - W_{post}\right)}{1000} \times Hours \times ISR \times IEF_E$$

Equation 23

For The remaining time in the EUL period., use the second tier EISA baseline:

$$\Delta kWh = \frac{\left(W_{base,ST} - W_{post}\right)}{1000} \times Hours \times ISR \times IEF_E$$

Equation 24

Annual energy (kWh) savings are calculated by weighting the EISA first and second tier savings by the EISA first tier period and the remainder of the EUL period, as outlined in the Volume 3 appendices.[66]

Where:

$W_{base,FT}$	=	*First tier EISA baseline wattage corresponding with the lumen output of the purchased LED lamp for the year purchased/installed. First tier EISA baseline lamp wattage provided in Table 2-19 under the column "Incandescent Equivalent 1st Tier EISA 2007" (if unknown, see Table 2-20 for 1st Tier EISA 2007default wattages)*

[66] While this appendix addresses early retirement installations, it is applicable to scenarios in which the baseline changes over the lifetime of the measure. For the purposes of this appendix, savings claimed against the Tier 1 EISA baseline may be treated as early retirement savings, and savings claimed against the Tier 2 EISA baseline may be treated as replace-on-burnout savings.

Table 2-20: ENERGY STAR® Omni-Directional LEDs—Default Equivalent Wattages if Lumen Output Unknown

Wattage Range of Installed LED[67]	5–8 W	8.5–12 W	12.5–16 W	17–23 W
If Unknown: Default Installed LED Wattage[68]	7 W	10 W	12 W	17 W
1st Tier EISA 2007 Default Baseline	29 W	43 W	53 W	72 W
2nd Tier EISA 2007 Default Baseline	12 W	20 W	28 W	45 W

$W_{base,ST}$ = *Second tier EISA baseline wattage corresponding with the lumen output of the purchased LED lamp for the year purchased/installed. Second tier EISA baseline lamp wattage provided in Table 2-19 under the column "Incandescent Equivalent 2nd Tier EISA 2007" (if unknown, see Table 2-20 for 2nd Tier EISA 2007default wattages)*

W_{post} = *Actual wattage of LED purchased/installed*

HOU = *Average hours of use per year = 803 hours (calculated based on an average daily usage of 2.2 hours per day[69])*

IEF_E = *Interactive Effects Factor to account for cooling energy savings and heating energy penalties associated with lighting power reductions (see Table 2-21)*

ISR = *In-Service Rate, the percentage of incentivized units that are installed and in use (rather than removed, stored, or burnt out) to account for units incentivized but not operating = 0.97* [70]

[67] Wattage ranges from ENERGY STAR® light bulb savings calculator. Updated June 2015. http://www.energystar.gov/products/certified-products/detail/light-bulbs.

Table 2-21: ENERGY STAR® Omni-Directional LEDs Interactive Effects for Cooling Energy Savings and Heating Energy Penalties[71]

IEF_E					
Heating/Cooling Type*	**Climate Zone 1**	**Climate Zone 2**	**Climate Zone 3**	**Climate Zone 4**	**Climate Zone 5**
Gas heat with AC	1.06	1.13	1.17	1.15	1.12
Gas heat with no AC	1.00	1.00	1.00	1.00	1.00
Heat pump	0.91	1.00	1.05	1.11	0.97
Electric resistance heat with AC	0.65	0.80	0.90	1.00	0.75
Electric resistance heat with no AC	0.57	0.69	0.76	0.83	0.65
No heat with AC	1.06	1.13	1.17	1.15	1.12
Unconditioned space	1.00	1.00	1.00	1.00	1.00
Heating/cooling unknown[72,73]	0.88	0.98	1.04	1.07	0.95

* IEF for homes with no AC are most appropriate for customers with evaporative cooling or room air conditioners.

Demand Savings

Summer and winter demand savings are determined by applying a coincidence factor associated with each season. Annual summer or winter peak demand (kW) savings must be calculated separately for two time periods:

1. First Tier EISA Baseline = 2021 – installation year
2. The remaining time in the EUL period

For the first tier EISA baseline period:

$$\Delta kW summer = \frac{(W_{base,FT} - W_{post})}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

Equation 25

[71] Extracted from BEopt energy models used to estimate savings for envelope measures. Referencing the EISA baseline table, the typical lumen output was determined by taking the midpoint for the 60 watt equivalent lamp (900 lm), which was assumed to be the most typical installation. The resulting lumens were divided by the default wattage for incandescents (43 W), CFLs (13 W), and LEDs (10 W) resulting in an assumed efficacy for incandescents (21 lm/W), CFLs (70 lm/W), and LEDs (90 lm/W). IEF values were calculated using the following formula: 1 + $HVAC_{savings}/Lighting_{savings}$.

[72] Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

[73] Also applies to upstream lighting.

$$\Delta kWwinter = \frac{\left(W_{base,FT} - W_{post}\right)}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

Equation 26

For The remaining time in the EUL period., use the second tier EISA baseline:

$$\Delta kW_{summer} = \frac{\left(W_{base,ST} - W_{post}\right)}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

Equation 27

$$\Delta kW_{winter} = \frac{\left(W_{base,ST} - W_{post}\right)}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

Equation 28

Annual summer or winter peak demand savings are calculated by weighting the EISA first and second tier savings by the EISA first tier period and the remainder of the EUL period, as outlined in the Volume 3 appendices.[74]

Where:

CF = *Coincidence Factor (see Table 2-22)*

IEF_D = *Interactive Effects Factor to account for cooling demand savings or heating demand penalties associated with lighting power reductions (see Table 2-23)*

Table 2-22: ENERGY STAR® LEDs—Coincidence Factors[75]

Season	Climate Zone 1: Amarillo	Climate Zone 2: Dallas	Climate Zone 3: Houston	Climate Zone 4: Corpus Christi	Climate Zone 5: El Paso
Summer	0.060	0.053	0.063	0.059	0.032
Winter	0.277	0.232	0.199	0.267	0.357

[74] While this appendix addresses early retirement installations, it is applicable to scenarios in which the baseline changes over the lifetime of the measure. For the purposes of this appendix, savings claimed against the Tier 1 EISA baseline may be treated as early retirement savings, and savings claimed against the Tier 2 EISA baseline may be treated as replace-on-burnout savings.

[75] See Volume 1, Appendix B.

Table 2-23: ENERGY STAR® Omni-directional LEDs—Interactive Effects Factor for Cooling Demand Savings and Heating Demand Penalties[76]

$IEF_{D,summer}$

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The average measure life is based upon rated lamp life of the LED. The measure life assumes an average use of 2.2 hours per day based on blended usage for indoor/outdoor applications and applies a 0.85 degradation factor to indoor/outdoor LEDs. The algorithms below are designed to provide EISA Tier 1 and EISA Tier 2 measure lives, each to be applied to the appropriate tier of EISA savings.

$$EUL_{Total} = \frac{Rated\ Life \times DF}{HOU \times 365.25}$$

Equation 29

$$EUL_{Tier1} = 2021 - Purchase\ Year$$

Equation 30

$$EUL_{Tier2} = EUL_{Total} - EUL_{Tier1}$$

Equation 31

[80] Also applies to upstream lighting.

Where:

$Rated\ Life$ = *10,000 hours, 12,000 hours, 15,000 hours, or 20,000 hours, as specified by the manufacturer. If unknown, assume a 10,000-hour lifetime.*[81]

DF = *0.85 degradation factor*[82]

HOU = *2.2 hours per day*[83]

2021 = *One-year lag applied to year that EISA Tier 1 energy efficiency standard ends*

Purchase year = *Current program year*

Table 2-24: ENERGY STAR® Omni-Directional LEDs—Estimated Useful Life

Range of Rated Measure Life (Hours)	Assumed Rated Measure Life (Hours)	Total Measure Life (Years)	EISA 1st Tier Standard Baseline Measure Life (Years)	EISA 2nd Tier Measure Life (Years)
≤ 17,500	15,000	16	2	14
> 17,500	20,000	20*	2	18

* Measure life capped at 20 years. EUL may be deemed at 16 years in lieu of collecting manufacturer rated life.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Number of LEDs installed
- Wattage of each installed LED
- Lumen output of each installed LED
- Wattage of replaced lamp
- Manufacturer-rated lifetime of each installed LED in hours
- Heating system type (gas, electric resistance, heat pump) for each home in which an LED is installed

2.1.4 ENERGY STAR® Specialty and Directional LED Lamps Measure Overview

TRM Measure ID: R-LT-SD

Market Sector: Residential

Measure Category: Lighting

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive and direct install

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure provides a method for calculating savings for replacement of an incandescent or halogen reflector or decorative lamp with an ENERGY STAR® -qualified LED lamp. These lamps include reflectors, G-shape lamps, T-shape lamps, B, BA, CA, F G16-1/2, G25, G30, S or M14 lamps.[84]

Eligibility Criteria

Customer eligibility to be awarded these deemed savings is at the discretion of the utility for different program and customer types. See program-specific manuals to determine customer eligibility.

These savings values rely on usage patterns specific to indoor applications, and therefore should not be applied to outdoor lighting. However, this should not be construed to restrict upstream lighting programs, through which customers purchase efficient lighting products in-store. Future versions of this document may provide savings specific to outdoor and/or upstream applications.

[84] http://www.energystar.gov/products/certified-products/detail/light-bulbs.

Baseline Condition

The baseline wattage will be determined based on the bulb shape of the installed lamp as outlined below.

Some baseline conditions for specialty LEDs are affected by EISA and/or a DOE 2009 ruling on incandescent reflector lamps (IRLs). Based on the shape, lumen output, and/or wattage-equivalent of the installed lamp, the appropriate baseline shall be determined from one of the following categories:

- Non-reflector lamps, affected by EISA 2007
- Non-reflector lamps, not affected by EISA 2007
- Reflector lamps affected by the DOE ruling in 2009 on IRLs
- Reflector lamps not affected by the DOE ruling in 2009 on IRLs

Appropriate baseline wattages are presented in Table 2-28 through Table 2-31. If a baseline cannot be determined using these tables, the following guidelines may be used to determine appropriate default baseline wattage:

- Non-reflector lamps, affected by EISA 2007: using the exact or range of the installed wattage, determine the appropriate First Tier or Second Tier EISA baseline default wattage in Table 2-26

Table 2-26: ENERGY STAR® Specialty LEDs—Default Equivalent Wattages if Lumen Output Unknown

Wattage Range of Installed LED[85]	5–8 W	8.5–12 W	12.5–16 W	17–23 W
If Unknown: Default Installed LED Wattage[86]	7 W	10 W	12 W	17 W
1st Tier EISA 2007 Default Baseline	29 W	43 W	53 W	72 W
2nd Tier EISA 2007 Default Baseline	12 W	20 W	28 W	45 W

- Non-reflector lamps, not affected by EISA 2007: 60 watts[87]
- Reflector lamps affected by the DOE ruling in 2009 on IRLs: 60 watts[88]
- Reflector lamps not affected by the DOE ruling in 2009 on IRLs: the appropriate default baseline may be determined using Table 2-27

[85] Wattage ranges from ENERGY STAR® light bulb savings calculator. Updated June 2015. http://www.energystar.gov/products/certified-products/detail/light-bulbs.

[86] ENERGY STAR® Certified Light Bulbs. https://www.energystar.gov/productfinder/download/certified-light-bulbs. Accessed October 6, 2015. Mean wattages of omnidirectional, general purpose replacement LED lamps by incandescent wattage equivalent.

[87] A 2006-2008 California Upstream Lighting Evaluation found an average incandescent wattage of 61.7 Watts (KEMA, Inc., The Cadmus Group, Itron, Inc., PA Consulting Group, Jai J. Mitchell Analytics, Draft Evaluation Report: Upstream Lighting Program. Prepared for the California Public Utilities Commission, Energy Division. December 10, 2009)

[88] Ibid.

Table 2-27: DOE-Ruling Exempt Reflectors—Default Wattages

Lamp Type	W_{Base}
BR30 (65 W)	65 W
BR40 (65 W)	
ER40 (65 W)	
R20 (≤ 45 W)	45 W
BR30 (≤ 50 W)	50 W
BR40 (≤ 50 watt)	
ER30 (≤ 50 watt)	
ER40 (≤ 50 watt)	
Indeterminate	60 W[89]

EISA Standards: Baseline for Non-Reflector Lamps

EISA-Affected

EISA-affected bulbs are:

- G-shape lamps with a diameter less than 5 inches
- T-shape lamps greater than 40 watts or a length of 10 inches or less
- B, BA, CA, F G16-1/2, G25, G30, S or M14 lamps greater than 40 watts[90]

Baseline wattages should be adjusted as EISA regulations dictate higher efficiency standards. The second tier of EISA 2007 (EISA Tier 2) regulation goes into effect beginning January 2020. However, due to expected lamp replacement schedules, as well as retailer sell-through of existing lighting stock, the 1st Tier EISA baseline will be retained until 2021 when the 2nd Tier EISA baseline will be applied.[91] Nevertheless, incentivized lamps installed in 2020 will be awarded savings against the 2nd Tier EISA baseline since this will be the standard in effect at the time of installation.

91 This is consistent with the one-year lag applied in the Arkansas TRM Version 4.0 to new standards effective before July 1 of a given year. Arkansas Technical Reference Manual, Version 4.0. Prepared for the Arkansas Public Service Commission. Approved in Docket 10-100-R. Section II – Protocol E. Page 48. http://www.apscservices.info/EEInfo/TRM4.pdf.

Table 2-28: EISA-Affected Specialty LED Baselines (Non-Reflectors)[92]

Lamp Type	Minimum Lumens	Maximum Lumens	Incandescent Equivalent 1st Tier EISA 2007 ($W_{Base,FT}$)	Incandescent Equivalent 2nd Tier EISA 2007 ($W_{Base,ST}$) [93]	Effective Dates For 2nd Tier EISA 2007 Standards*
• G-shape lamps with a diameter less than 5 inches • T-shape lamps greater than 40 watts or a length of 10 inches or less • B, BA, CA, F G16-1/2, G25, G30, S or M14 lamps greater than 40 watts	310	749	29	12	1/1/2020
	750	1,049	43	20	1/1/2020
	1,050	1,489	53	28	1/1/2020
	1,490	2,600	72	45	1/1/2020

* While 2nd Tier EISA standards are effective beginning in 2020, 1st Tier EISA baselines will be used until 2021.

EISA-Exempt

EISA-exempt bulbs are:

- Appliance lamps, black light lamps, bug lamps, colored lamps, infrared lamps, left-hand thread lamps, marine lamps, marine signal service lamps, mine service lamps, plant light lamps, reflector lamps, rough service lamps, shatter-resistant lamps, sign service lamps, silver bowl lamps, showcase lamps, 3-way incandescent lamps, and vibration service lamps
- G-shape lamp with a diameter of 5 inches or more
- T-shape lamp of 40 watts or less or a length of more than 10 inches
- B, BA, CA, F, G16-1/2, G25, G30, S or M14 lamp of 40 watts or less[94]

92 Ibid.

93 Wattages developed using the 45 lumens-per-watt standard for the midpoint of the provided lumen range.

Table 2-29: EISA-Exempt Specialty LED Baselines (Non-Reflectors)

Lamp Type	Minimum Lumens	Maximum Lumens	W_{Base}
• Appliance lamps, black light lamps, bug lamps, colored lamps, infrared lamps, left-hand thread lamp, marine lamp, marine signal service lamp, mine service lamp, plant light lamp, reflector lamp, rough service lamp, shatter-resistant lamp, sign service lamp, silver bowl lamp, showcase lamp, 3-way incandescent lamp, vibration service lamp • G-shape lamp with a diameter of 5 inches or more • T-shape lamp of 40 watts or less or a length of more than 10 inches • B, BA, CA, F, G16-1/2, G25, G30, S or M14 lamp of 40 watts or less	Nameplate wattage on the removed product. If unknown, utilities may rely on the rated incandescent wattage equivalent of the newly installed lamp as provided by the manufacturer if available. Otherwise, use 60 watts.[95]		

DOE Standards for Incandescent Reflector Lamps (IRLs): Baseline for Reflector Lamps

DOE Ruling-Affected

Certain types of incandescent reflector bulbs are affected by a DOE 2009 ruling on reflector lamps. Products affected by the IRL ruling are:

- R, PAR, ER, BR, BPAR lamps
- BR and ER lamps rated at more than 50 watts
- Reflector lamps between 2.25" (R18) and 2.75" (R22) in diameter
- 40-205 Watt incandescent PAR lamps[96]

Where available, the nameplate wattage of the removed lamp should be used as the baseline. Otherwise, the baseline wattage can be determined according to the lumen range of the installed lamp (see Table 2-20).

[95] A 2006-2008 California Upstream Lighting Evaluation found an average incandescent wattage of 61.7 Watts (KEMA, Inc., The Cadmus Group, Itron, Inc., PA Consulting Group, Jai J. Mitchell Analytics, Draft Evaluation Report: Upstream Lighting Program. Prepared for the California Public Utilities Commission, Energy Division. December 10, 2009)

	801-950	110
	951-1100	125
R40	1300-1900	125

DOE Ruling-Exempt

The DOE 2009 ruling standards do not apply to the following types of IRLs:

- IRLs rated at 50 watts or less that are ER30, BR30, BR40, or ER40 lamps
- IRLs rated at 65 watts that are BR30, BR40, or ER40 lamps
- R20 IRLs rated 45 watts or less.[99]

Table 2-31: DOE-Ruling Exempt Reflectors

Lamp Type	W_{Base}
BR30 (65 watt)	Nameplate wattage on the removed product. If unknown, utilities may rely on the rated incandescent wattage equivalent of the newly installed lamp as provided by the manufacturer if available. Otherwise, use 65 watts.
BR40 (65 watt)	
ER40 (65 watt)	
R20 (≤ 45 watt)	Nameplate wattage on the removed product. If unknown, utilities may rely on the rated incandescent wattage equivalent of the newly installed lamp as provided by the manufacturer if available. Otherwise, use 45 watts.
BR30 (≤ 50 watt)	Nameplate wattage on the removed product. If unknown, utilities may rely on the rated incandescent wattage equivalent of the newly installed lamp as provided by the manufacturer if available. Otherwise, use 50 watts.
BR40 (≤ 50 watt)	
ER30 (≤ 50 watt)	
ER40 (≤ 50 watt)	

[99] http://www.gelighting.com/LightingWeb/na/resources/legislation/2009-department-of-energy-regulations/. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/58.

High-Efficiency Condition

LEDs must be ENERGY STAR® -qualified for the relevant lamp shape being removed as outlined in the latest ENERGY STAR® specification.[100] These lamps include reflectors, G-shape lamps, T-shape lamps, B, BA, CA, F G16-1/2, G25, G30, S or M14 lamps.

The high-efficiency condition is the wattage of the lamp installed.

See the ENERGY STAR® website for more information on the specification in effect: http://www.energystar.gov/products/certified-products/detail/light-bulbs.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Wattage reduction is defined as the difference between the wattage of a specialty baseline lamp and the wattage of a directional or specialty LED.

Energy Savings

For EISA-affected lamps only, annual energy (kWh) savings must be calculated separately for two time periods:

- First Tier EISA Baseline = 2021 – installation year
- The remaining time in the EUL period

For the first tier EISA baseline period:

$$\Delta kWh = \frac{\left(W_{base,FT} - W_{post}\right)}{1000} \times HOU \times ISR \times IEF_E$$

Equation 32

For The remaining time in the EUL period., use the second tier EISA baseline:

$$\Delta kWh = \frac{\left(W_{base,ST} - W_{post}\right)}{1000} \times HOU \times ISR \times IEF_E$$

Equation 33

Annual energy (kWh) savings are calculated by weighting the EISA first and second tier savings by the EISA first tier period and the remainder of the EUL period, as outlined in the Volume 3 appendices.[101]

---

100 http://www.energystar.gov/products/certified-products/detail/light-bulbs

101 While this appendix addresses early retirement installations, it is applicable to scenarios in which the baseline changes over the lifetime of the measure. For the purposes of this appendix, savings claimed against the Tier 1 EISA baseline may be treated as early retirement savings, and savings claimed against the Tier 2 EISA baseline may be treated as replace-on-burnout savings.

For EISA- exempt lamps and reflectors (both DOE ruling-exempt and DOE ruling-affected), annual energy (kWh) savings are not calculated using the two-tiered system. Instead, annual energy (kWh) savings are calculated using one algorithm.

$$\Delta kWh = \frac{\left(W_{base} - W_{post}\right)}{1000} \times HOU \times ISR \times IEF_E$$

Equation 34

Where:

$W_{base,FT}$ = *First tier EISA baseline wattage corresponding with the lumen output of the purchased LED lamp for the year purchased/installed. First tier EISA baseline lamp wattage provided in Table 2-28 under the column "Incandescent Equivalent 1st Tier EISA 2007."*

$W_{base,ST}$ = *Second tier EISA baseline wattage corresponding with the lumen output of the purchased LED lamp for the year purchased/installed. Second tier EISA baseline lamp wattage provided in Table 2-28 under the column "Incandescent Equivalent 2nd Tier EISA 2007".*

W_{base} = *EISA-exempt specialty lamp or a DOE ruling-exempt reflector, use the nameplate wattage (see Table 2-29 and Table 2-31. If a DOE-ruling-affected IRL, use the wattages provided in Table 2-30.*

W_{post} = *Actual wattage of LED purchased/installed*

HOU = *Average hours of use per year = 803 hours (calculated based on an average daily usage of 2.2 hours per day[102])*

IEF_E = *Interactive Effects Factor to account for cooling energy savings and heating energy penalties associated with lighting power reductions (see Table 2-32).*

ISR = *In-Service Rate, the percentage of incentivized units that are installed and in use (rather than removed, stored or burnt out) to account for units incentivized but not operating = 0.97* [103]

---

102 The average daily usage of 2.2 hours per day is a blended value for indoor and outdoor lamps. Source: Evaluation of 2008 Texas 'Make Your Mark' Statewide CFL Program Report. Frontier Associates. June 2009.

103 Dimetrosky, S., Parkinson, K. and Lieb, N. "Residential Lighting Evaluation Protocol – The Uniform Methods Project: Methods for Determining Energy Efficiency Savings for Specific Measures." January 2015. ISR for upstream programs, including storage lamps installed within four years of purchase. http://energy.gov/sites/prod/files/2015/02/f19/UMPChapter21-residential-lighting-evaluation-protocol.pdf.

Table 2-32: ENERGY STAR® Specialty and Directional LEDs—Interactive Effects for Cooling Energy Savings and Heating Energy Penalties[104]

IEF$_E$					
Heating/Cooling Type*	Climate Zone 1	Climate Zone 2	Climate Zone 3	Climate Zone 4	Climate Zone 5
Gas Heat with AC	1.06	1.13	1.17	1.15	1.12
Gas Heat with no AC	1.00	1.00	1.00	1.00	1.00
Heat Pump	0.91	1.00	1.05	1.11	0.97
Electric Resistance Heat with AC	0.65	0.80	0.90	1.00	0.75
Electric Resistance Heat with no AC	0.57	0.69	0.76	0.83	0.65
No heat with AC	1.06	1.13	1.17	1.15	1.12
Unconditioned Space	1.00	1.00	1.00	1.00	1.00
Heating/Cooling Unknown[105,106]	0.88	0.98	1.04	1.07	0.95

* IEF for homes with no AC are most appropriate for customers with evaporative cooling or room air conditioners.

Demand Savings

Summer and winter demand savings are determined by applying a coincidence factor associated with each season. For EISA-affected specialty lamps only, peak demand (kW) savings must be calculated separately for two time periods:

- First Tier EISA Baseline = 2021 – installation year
- The remaining time in the EUL period

For the first tier EISA baseline period:

$$\Delta kW_{summer} = \frac{(W_{base,FT} - W_{post})}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

Equation 35

$$\Delta kW_{winter} = \frac{(W_{base,FT} - W_{post})}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

Equation 36

104 Extracted from BEopt energy models used to estimate savings for envelope measures. Referencing the EISA baseline table, the typical lumen output was determined by taking the midpoint for the 60 watt equivalent lamp (900 lm), which was assumed to be the most typical installation. The resulting lumens were divided by the default wattage for incandescents (43 W), CFLs (13 W), and LEDs (10 W) resulting in an assumed efficacy for incandescents (21 lm/W), CFLs (70 lm/W), and LEDs (90 lm/W). IEF values were calculated using the following formula: 1 + $HVAC_{savings}/Lighting_{savings}$.

105 Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

106 Also applies to upstream lighting.

For The remaining time in the EUL period., use the second tier EISA baseline:

$$\Delta kW_{summer} = \frac{\left(W_{base,ST} - W_{post}\right)}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

Equation 37

$$\Delta kW_{winter} = \frac{\left(W_{base,ST} - W_{post}\right)}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

Equation 38

Annual summer or winter peak demand savings are calculated by weighting the EISA first and second tier savings by the EISA first tier period and the remainder of the EUL period, as outlined in the Volume 3 appendices.[107]

<u>For EISA- exempt lamps and reflectors (both DOE ruling-exempt and DOE ruling-affected)</u>, peak demand (kW) savings are not calculated using the two-tiered system. Instead, peak demand (kW) savings are calculated using one algorithm, depending on the season of the savings.

$$\Delta kW_{summer} = \frac{\left(W_{base} - W_{post}\right)}{1000} \times CF_{summer} \times ISR \times IEF_{D,summer}$$

Equation 39

$$\Delta kW_{winter} = \frac{\left(W_{base} - W_{post}\right)}{1000} \times CF_{winter} \times ISR \times IEF_{D,winter}$$

Equation 40

Where:

CF = *Coincidence Factor (Table 2-33)*

IEF_D = *Interactive Effects Factor to account for cooling demand savings or heating demand penalties associated with lighting power reductions (see Table 2-34)*

Table 2-33: ENERGY STAR® LEDs—Coincidence Factors[108]

Season	Climate Zone 1: Amarillo	Climate Zone 2: Dallas	Climate Zone 3: Houston	Climate Zone 4: Corpus Christi	Climate Zone 5: El Paso
Summer	0.060	0.053	0.063	0.059	0.032
Winter	0.277	0.232	0.199	0.267	0.357

107 While this appendix addresses early retirement installations, it is applicable to scenarios in which the baseline changes over the lifetime of the measure. For the purposes of this appendix, savings claimed against the Tier 1 EISA baseline may be treated as early retirement savings, and savings claimed against the Tier 2 EISA baseline may be treated as replace-on-burnout savings.

[113] Also applies to upstream lighting.

Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The average measure life is based upon rated lamp life of the LED. The measure life assumes an average use of 2.2 hours per day based on blended usage for indoor/outdoor applications and applies a 0.85 degradation factor to indoor/outdoor LEDs. The algorithms below are designed to provide EISA Tier 1 and EISA Tier 2 measure lives, each to be applied to the appropriate tier of EISA savings.

$$EUL_{Total} = \frac{Rated\ Life \times DF}{HOU \times 365.25}$$

Equation 41

$$EUL_{Tier1} = 2021 - Purchase\ Year$$

Equation 42

$$EUL_{Tier2} = EUL_{Total} - EUL_{Tier1}$$

Equation 43

Where:

$Rated\ Life$	=	*10,000 hours, 12,000 hours, 15,000 hours, or 20,000 hours, as specified by the manufacturer. If unknown, assume a 10,000-hour lifetime.*[114]
DF	=	*0.85 degradation factor*[115]
HOU	=	*2.2 hours per day*[116]
2021	=	*One-year lag applied to year that EISA Tier 1 energy efficiency standard ends*
Purchase year	=	*Current program year*

Table 2-35: ENERGY STAR® Specialty LEDs—Estimated Useful Life

Range of Rated Measure Life (Hours)	Assumed Rated Measure Life (Hours)	Total Measure Life (Years)	If Applicable:	
			EISA 1st Tier Standard Baseline Measure Life (Years)	EISA 2nd Tier Measure Life (Years)
≤ 17,500	15,000	16	2	14
> 17,500	20,000	20*	2	18

* Measure life capped at 20 years. EUL may be deemed at 16 years in lieu of collecting manufacturer rated life.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Number of LEDs installed
- ANSI C79.1-2002 nomenclature of CFL installed (G40, PAR, etc.)
- Wattage of each installed LED
- Lumen output of each installed LED
- Wattage of replaced lamp

2.2 RESIDENTIAL: HEATING, VENTILATION, AND AIR CONDITIONING

2.2.1 Air Conditioner or Heat Pump Tune-ups Measure Overview

TRM Measure ID: R-HV-TU

Market Sector: Residential

Measure Category: HVAC

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure applies to central air conditioners and heat pumps of any configuration where all applicable actions from the checklist below are completed. An AC tune-up involves checking, cleaning, adjusting, and resetting the equipment to factory conditions in the understanding that such measures restore operating efficiencies, on average, closer to as-new performance. This measure applies to all residential applications.

For this measure, the service technician must complete the following tasks according to industry best practices. To properly assess and adjust the refrigerant charge level, the unit must be operating under significant (i.e., normal) cooling load conditions. Therefore, this measure may only be performed for energy savings reporting purposes when the outdoor ambient dry bulb temperature is above 75˚F, and the indoor return air dry bulb temperature is above 70˚F.

Air conditioner Inspection and Tune-Up Checklist[117]

- Tighten all electrical connections and measure voltage and current on motors
- Lubricate all moving parts, including motor and fan bearings
- Inspect and clean the condensate drain

[117] Based on ENERGY STAR® HVAC Maintenance Checklist. www.energystar.gov/index.cfm?c=heat_cool.pr_maintenance.

- Inspect controls of the system to ensure proper and safe operation. Check the startup/shutdown cycle of the equipment to assure the system starts, operates, and shuts off properly.
- Clean evaporator and condenser coils
- Clean indoor blower fan components
- Inspect and clean or change air filters; replacement preferred best practice
- Measure airflow via static pressure across the cooling coil and adjust to manufacturers specifications
- Check refrigerant level and adjust to manufacturer specifications
- Check capacitor functionality and capacitance and compare to OEM specifications

Eligibility Criteria

All residential customers are eligible for this measure if they have refrigerated air conditioning 65,000 Btu/hr or less in cooling capacity that has not been serviced in the last 5 years.

Baseline Condition

The baseline is a system with some or all of the following issues:

- Dirty condenser coil
- Dirty evaporator coil
- Dirty blower wheel
- Dirty filter
- Improper airflow
- Incorrect refrigerant charge

The baseline system efficiency should be calculated using the following formulas:

$$EER_{pre} = (1 - EL) \times EER_{post}$$

Equation 44

$$HSPF_{pre} = (1 - EL) \times HSPF_{post}$$

Equation 45

Where:

EER_{pre} = *Efficiency of the cooling equipment before tune-up*

EL = *Efficiency loss due to dirty coils, blower, filter, improper airflow, and/or incorrect refrigerant charge = 0.05*

EER_{post} = *Deemed cooling efficiency of the equipment after tune-up = 11.2 EER*

$HSPF_{pre}$ = *Heating efficiency of the air source heat pump before tune-up*

$HSPF_{post}$ = *Deemed heating efficiency of air source heat pumps after tune-up = 7.7 HSPF*

High-Efficiency Condition

After the tune-up, the equipment must be clean with airflows and refrigerant charges adjusted as appropriate and set forth above, with the added specification that refrigerant charge adjustments must be within +/- 3 degrees of target sub-cooling for units with thermal expansion valves (TXV) and +/- 5 degrees of target super heat for units with fixed orifices or capillary tubes.

The efficiency standard, or efficiency after the tune-up, is deemed to be the manufacturer specified energy efficiency ratio (EER) of the existing central air conditioner or heat pump, which has been determined using the following logic and standards. The useful life of an AC unit is 19 years. The useful life of a heat pump is 16 years. Therefore, it is conservatively thought that the majority of existing, functioning units were installed under the federal standard in place between January 23, 2006 and January 1, 2015, which set a baseline of 13 SEER and 7.7[118] HSPF. A 13 SEER is equivalent to approximately 11.2 EER[119] using the conversion developed by Lawrence Berkeley Lab and US DOE: EER = -0.02 x SEER^2 + 1.12 x SEER.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Savings are based on an assumed efficiency loss factor of 5 percent due to dirty coils, dirty filters, improper airflow, and/or incorrect refrigerant charge.[120]

Energy Savings Algorithms

Heating energy savings are only applicable to heat pumps.

$$Energy\ Savings\ [kWh_{savings}] = kWh_{Savings,C} + kWh_{Savings,H}$$

Equation 46

$$\boldsymbol{Energy\ (Cooling)\ [kWh_{Savings,C}] = Capacity \times \left(\frac{1}{EER_{pre}} - \frac{1}{EER_{post}}\right) \times EFLH_C \times \frac{1\ kW}{1,000\ W}}$$

Equation 47

---

118 Code specified HSPF from federal standard effective January 23, 2006 through January 1, 2015.

119 Code specified 13 SEER from federal standard effective January 23, 2006 through January 1, 2015, converted to EER using EER = -0.02 x SEER^2 + 1.12 x SEER. National Renewable Energy Laboratory (NREL). “Building America House Simulation Protocols.” U.S. Department of Energy. Revised October 2010. http://www.nrel.gov/docs/fy11osti/49246.pdf.

120 Energy Center of Wisconsin, May 2008; “Central Air Conditioning in Wisconsin, A Compilation of Recent Field Research.”

$$\boldsymbol{Energy\ (Heating)\ [kWh_{Savings,H}] = Capacity \times \left(\frac{1}{HSPF_{pre}} - \frac{1}{HSPF_{post}}\right) \times EFLH_H \times \frac{1\ kW}{1,000\ W}}$$

Equation 48

Where:

Capacity	=	*Rated cooling capacity of the equipment based on model number [Btuh] (1 ton = 12,000 Btuh)*
EER_{pre}	=	*Cooling efficiency of the equipment pre-tune-up using Equation 44 [Btuh/W]*
EER_{post}	=	*Cooling efficiency of the equipment after the tune-up [Btuh/W]. Assume 11.2.*
$HSPF_{pre}$	=	*Heating efficiency of the equipment pre-tune-up using Equation 45 [Btuh/W]*
$HSPF_{post}$	=	*Heating efficiency of the equipment after the tune-up [Btuh/W]. Assume 7.7.*
$EFLH_{C/H}$	=	*Cooling/heating equivalent full-load hours for appropriate climate zone [hours]*

Table 2-37: Equivalent full load cooling/heating hours[121]

Climate Zone	$EFLH_C$	$EFLH_H$
Climate Zone 1: Panhandle	1,142	1,880
Climate Zone 2: North	1,926	1,343
Climate Zone 3: South	2,209	1,127
Climate Zone 4: Valley	2,958	776
Climate Zone 5: West	1,524	1,559

121 ENERGY STAR® Central AC/HP Savings Calculator. https://www.energystar.gov/products/certified-products/detail/heat-pumps-air-source.

Demand Savings Algorithms

$$\textit{Summer Peak Demand}\left[kW_{Savings,C}\right] = Capacity \times \left(\frac{1}{EER_{pre}} - \frac{1}{EER_{post}}\right) \times DF_C \times \frac{1\ kW}{1,000\ W}$$

Equation 49

$$\textit{Winter Peak Demand}\left[kW_{Savings,H}\right] = Capacity \times \left(\frac{1}{HSPF_{pre}} - \frac{1}{HSPF_{post}}\right) \times DF_H \times \frac{1\ kW}{1,000\ W}$$

Equation 50

Summer and winter demand savings are determined by applying a coincidence factor for each season. Winter peak demand savings are only applicable to heat pumps.

Where:

DF_C = *Cooling demand factor*[122] *= 0.87*

DF_H = *Heating demand factor = 0.83 (heat pumps, default)*[123]

Deemed Energy Savings Tables

Applying the above algorithms results in the deemed energy savings per ton in Table 2-38. Heating savings are only applicable for heat pumps.

Table 2-38: Deemed Energy Savings per Ton

Climate Zone	Cooling kWh Saved per Ton	Heating kWh Saved per Ton
Climate Zone 1: Panhandle	64.40	154.20
Climate Zone 2: North	108.61	110.16
Climate Zone 3: South	124.57	92.44
Climate Zone 4: Valley	166.80	63.65
Climate Zone 5: West	85.94	127.87

122 Air Conditioning Contractors of America (ACCA) Manual S recommends that residential air conditioners be sized at 115 percent of the maximum cooling requirement of the house. Assuming that the house's maximum cooling occurs during the hours 4 to 5 PM, the guideline leads to a coincidence factor for residential HVAC measures of 1.0/1.15 = 0.87.

123 Air Conditioning Contractors of America (ACCA) Manual S recommends that residential heat pumps be sized at 115 percent of the maximum cooling requirement of the house (for cooling dominated climates). Based on AHRI data for 1.5 to 5-ton HVAC systems, the average ratio of rated heating capacity to cooling capacity is 0.96. Assuming that the house's maximum cooling occurs during the hours 4 to 5 PM and adjusting for the average ratio of heating to cooling capacity, the guideline leads to a coincidence factor for residential heat pumps of 0.96/1.15 = 0.83.

Deemed Summer Demand Savings Tables

Applying the above algorithms results in the deemed summer demand savings per ton in Table 2-39.

Table 2-39: Deemed Summer Demand Savings per Ton

Climate Zone	Summer Peak Demand kW Savings per Ton
All Zones	0.04906

Deemed Winter Demand Savings Tables

Applying the above algorithms results in the deemed winter demand savings per ton in Table 2-40. Winter peak demand savings are only applicable for heat pumps.

Table 2-40: Deemed Winter Demand Savings per Ton

Climate Zone	Winter Peak Demand kW Savings per Ton
All Zones	0.06808

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) for a tune-up is five years. [124]

According to the 2014 California Database for Energy Efficiency Resources (DEER), the estimated useful life of cleaning condenser and evaporator coils is three years [125], and the estimated useful life of refrigerant charge adjustment is ten years.[126] The other parts of the tune-up checklist are not listed in DEER, therefore five years, as referenced by the Measure Life Report, is used as the best representation of the entire tune-up.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone or county
- Manufacturer
- Model Number
- Cooling capacity of the installed unit (tons)
- Type of unit
- Air conditioner
- Air source heat pump
- Recommended:
- Serial number
- Refrigerant type
- Target superheat or subcooling
- Post tune-up superheat or subcooling
- Amount of refrigerant added or removed
- Static pressures before and after tune-up
- Return and supply dry bulb and wet bulb temperatures
- Before and after tune-up pictures of components illustrating condition change due to cleanings (Note: pictures that include well-placed familiar objects like hand tools often provide a sense of scale and a reference for color/shading comparisons. Pictures of equipment name plates are useful).
- References and Efficiency Standards

Petitions and Rulings

2.2.2 Duct Efficiency Improvements Measure Overview

TRM Measure ID: R-HV-DE

Market Sector: Residential

Measure Category: HVAC

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Building simulation modeling

Measure Description

This measure involves sealing leaks in supply and return ducts of the HVAC distribution systems of homes or converted residences with central air conditioning. The standard approach for estimating savings in this measure is based on the results obtained via pre- and post-leakage testing as defined in this measure. In lieu of leakage testing, savings for eligible duct sealing projects may be claimed using the alternative approach specified in this measure.

Eligibility Criteria

All residential customers with refrigerated air conditioning or evaporative cooling are eligible to claim cooling savings for this measure. Customers must have central heating with either a furnace (gas or electric resistance) or a heat pump to claim heating savings.

For the standard approach with leakage testing, duct leakage should be assessed following Building Performance Institute (BPI) standards. Duct leakage testing should not be conducted in homes where either evidence of asbestos or mold is present or suspected due to the age of the home.[127]

[127] The Building Performance Institute, Inc. (BPI) Standard Reference: Building Performance Institute Technical Standards for the Building Analyst Professional, v2/28/05mda, Page 1 of 17, states: **"Health and Safety:**
Where the presence of asbestos, lead, mold and/or other potentially hazardous material is known or suspected, **all relevant state and federal (EPA) guidelines must be followed to ensure technician and occupant safety**. Blower door depressurization tests may not be performed in homes *where there is a risk of asbestos becoming airborne and being drawn into the dwelling."*

Utility program manuals should be consulted for health and safety considerations related to implementation of duct efficiency measures and/or testing procedures.

Duct sealing is a residential retrofit measure only and does not apply to new construction.

Baseline Condition

The savings calculation methods for this measure (when implemented with duct leakage testing) are valid up to a maximum pre-installation leakage rate of 35 percent of total fan flow.[128] For homes with an initial leakage rate greater than 35 percent of total fan flow, savings will be awarded with respect to this cap rather than the initial leakage. Data from nearly 28,000 single-family and mobile home duct blaster tests conducted for duct efficiency improvements in Texas between 2003 and 2006 show that more than 70 percent of all pre-retrofit leakage rates fall below 38 percent total leakage.[129]

Engineering calculations show that the interior temperature in those settings that exceed 38 percent total leakage would be above the thermally acceptable comfort levels published by ASHRAE in its 2009 Fundamentals publication. The proposed pre-installation leakage limits will help ensure that the deemed savings are an accurate reflection of the program's impacts, and that the program focuses its efforts on scenarios where leakage conditions are likely to persist if unaddressed for several years.

Low-income customers[130] are exempt from the cap limiting the maximum pre-installation leakage rate to 35 percent of total fan flow.

While these baseline criteria were applied in deriving the deemed savings for the alternate approach (without duct leakage testing), it is not necessary to determine pre-installation leakage rate for projects claiming the alternate deemed savings.

High-Efficiency Condition

Materials used should be long-lasting materials, such as mastics, UL 181A or UL 181B approved foil tape, or aerosol-based sealants. Fabric-based duct tape is not allowed.

The selected methodology for estimating duct sealing deemed savings according to the standard approach requires duct leakage-to-outside testing using a combination duct pressurization and house pressurization.

Duct Leakage Testing (Standard Approach)

Measurements to determine pre-installation and post-installation leakage rates must be performed in accordance with utility-approved procedures. For this measure, leakage-to-outside must be directly measured. The Project Sponsor shall use the Combination Duct Blaster™ (or equivalent) and Blower Door method. Prior to beginning any installations, the Project Sponsor must submit the intended method(s) and may be required to provide the utility with evidence of

[128] $Total\ Fan\ Flow = Cooling\ Capacity\ (tons) \times 400\ cfm/ton$

[129] Based on data collected by Frontier Associates, LLC for investor-owned utilities in Texas.

[130] Low-income customers are income-eligible customers served through a targeted low-income energy efficiency program as described in 25.181(r). This may also apply to income-eligible customers served through a hard-to-reach program that is also delivered following the guidelines in 25.181(r).

competency, such as Home Energy Rating System (HERS) or North American Technician Excellence (NATE) certification. Leakage rates must be measured and reported at the average air distribution system operating pressure (25 Pa).[131]

Categorizing Achieved Duct Leakage Reduction (Absent Leakage Testing)

Participating energy efficiency service providers (EESPs) electing not to perform leakage testing should nevertheless provide an estimate of the expected outcome of the leakage reduction work performed: projects should be characterized according to contractor estimation of whether the work required should result in ***low***, ***average***, or ***high reduction*** in duct system leakage. EESPs should take the following considerations into account in assessing the likely leakage reduction achieved in a given project:

- The number and size of repaired leaks
- Leak location: a leak in an attic joint will cause more energy loss than a joint that leaks to conditioned space
- Supply/Return: Supply-side leaks, particularly in the return air plenum and near the air handling unit can be especially problematic, as they tend to draw additional unconditioned air into the system.

Systems that were not initially very leaky and in which few joints and supply vents were sealed should be characterized as low reduction. Jobs with a typical number of supply vents and joints sealed, and in which the supply air return or the return air plenum were sealed, should be characterized as average reduction. Jobs requiring significant interventions to eliminate large or numerous leaks should be considered high reduction.

The following table provides a guideline for selecting an appropriate leakage category. How the category is determined may fluctuate on a per home basis.

[131] See RESNET Technical Committee, Proposed Amendment: Chapter 8 RESNET Standards, 800 RESNET Standard for Performance Testing and Work Scope: Enclosure and Air Distribution Leakage Testing; Section 803.2 and Table 803.1.

Table 2-42: Leakage Categorization Guide[132]

Category	Duct Location	Duct Insulation Value	Leakage Characteristics[133]
Low	> 90% Conditioned	> R7	Some observable leaks
			Substantial leaks
		R4 - R7	Some observable leaks

			Catastrophic leaks
		< R4	Substantial leaks
			Catastrophic leaks

Energy and Demand Savings Methodology

Savings may be claimed according to either the standard approach (with duct leakage testing) or the alternate approach, according to the following sections.

[132] Based on typical distribution efficiency assumptions from the Building Performance Institute (BPI) Technical Standards for the Heating Professional, November 20, 2007, page 7.

[133] Catastrophic leaks are defined by BPI as disconnected ducts, missing end-caps, and other catastrophic holes.

Savings Algorithms and Input Variables

Calibrated simulation modeling was used to develop these deemed savings, which are expressed as linear functions of the reduction in duct leakage achieved (in CFM_{25}). Specifically, these deemed savings estimates were developed using BEopt 2.6, running EnergyPlus 8.4 as the underlying simulation engine. To model this measure, the prototype home models for each climate zone were modified as follows: the base case duct leakage rate was set to 8 CFM_{25} per 100 square feet. Results from running the base case model provide estimated hourly energy use for the prototypical home prior to treatment. Post-treatment conditions were simulated by setting the leakage rate to 6 CFM_{25} per 100 square feet. Results from running the change case model provide estimated hourly energy use for the prototypical home after treatment. Comparison of these two runs provides the deemed savings estimates.

Deemed savings are presented as a function of the CFM_{25} reduction achieved, as demonstrated by leakage to outside testing using the Combination Duct Blaster™ (or equivalent) and Blower Door method. The kWh and kW per CFM_{50} values represented by the V_E, V_S, and V_W coefficients are derived by taking the difference between annual energy use and summer and winter peak demand, as estimated by the two model runs, and normalizing to the CFM_{25} reduction achieved.

Standard Approach (with Duct Leakage Testing)

The annual energy and summer and winter peak demand savings to be claimed according to the standard approach for this measure shall be calculated as a function of the reduction in duct leakage achieved, using the energy and demand savings coefficients from Table 2-43 through Table 2-45 for the climate zone in which the project was implemented and the type of heating equipment in the project home.

Deemed Energy Savings Tables

Table 2-43 presents the annual energy savings per CFM_{25} reduction for a residential duct sealing project. The following formula shall be used to calculate annual energy savings for duct leakage reduction:

$$\boldsymbol{Deemed\ Energy\ Savings\ (kWh) = \left(DL_{pre} - DL_{post}\right) \times V_E}$$

Equation 51

Where:

$\mathrm{DL_{pre}}$	=	*Pre-improvement duct leakage at 25 Pa (cu. ft./min)*
$\mathrm{DL_{post}}$	=	*Post-improvement duct leakage at 25 Pa (cu. ft./min)*
$V_{E,C}$	=	*Cooling Energy Savings Coefficient in Table 2-43*
$V_{E,H}$	=	*Heating Energy Savings Coefficient in Table 2-43*

Table 2-43: Energy Savings V_E per CFM_{25} Reduction

Region	$V_{E,C}$: Cooling Savings		$V_{E,H}$: Heating Savings		
	Refrigerated Air	Evaporative Cooling	Gas Heat	Electric Resistance	Heat Pump
Zone 1: Panhandle	0.82	0.21	0.07	2.75	0.71
Zone 2: North	1.05	N/A	0.03	1.19	0.31
Zone 3: South	1.23	N/A	0.02	0.85	0.26
Zone 4: Valley	1.46	N/A	0.01	0.61	0.19
Zone 5: West	1.20	0.38	0.03	1.44	0.37

Deemed Summer Demand Savings Tables

Table 2-44 presents the summer peak demand savings per CFM_{25} reduction for a residential duct sealing project. The following formula shall be used to calculate deemed summer demand savings for duct leakage reduction:

$$\boldsymbol{Deemed\ Summer\ Demand\ Savings\ (kW) = \left(DL_{pre} - DL_{post}\right) \times V_S}$$

Equation 52

Where:

DL_{pre} = *Pre-improvement duct leakage at 25 Pa (cu. ft./min)*

DL_{post} = *Post-improvement duct leakage at 25 Pa (cu. ft./min)*

V_S = *Summer Demand Savings Coefficient in Table 2-240*

Table 2-44: Summer Demand Savings V_S per CFM_{25} Reduction

Region	Summer kW Impact per CFM_{25} Reduction	
	Refrigerated Air	Evaporative Cooling
Climate Zone 1: Panhandle	9.28E-04	2.29E-04
Climate Zone 2: North	8.47E-04	N/A
Climate Zone 3: South	1.06E-03	N/A
Climate Zone 4: Valley	6.72E-04	N/A
Climate Zone 5: West	7.66E-04	1.86E-04

Deemed Winter Demand Savings Tables

Table 2-45 presents the winter peak demand savings per CFM_{25} reduction for a residential duct sealing project. The following formula shall be used to calculate deemed winter demand savings for duct leakage reduction:

$$\boldsymbol{Deemed\ Winter\ Demand\ Savings\ (kW) = \left(DL_{pre} - DL_{post}\right) \times V_W}$$

Equation 53

Where:

DL_{pre} = *Pre-improvement duct leakage at 25 Pa (cu. ft./min)*

DL_{post} = *Post-improvement duct leakage at 25 Pa (cu. ft./min)*

V_W = *Winter Demand Savings Coefficient in Table 2-45*

Table 2-45: Winter Demand Savings V_W per CFM_{25} Reduction

Region	kWh Impact per CFM_{25} Reduction		
	Gas	Resistance	Heat Pump
Climate Zone 1: Panhandle	4.38E-06	8.49E-04	1.46E-04
Climate Zone 2: North	1.22E-06	9.96E-04	6.98E-04
Climate Zone 3: South	8.60E-06	8.61E-04	5.02E-04
Climate Zone 4: Valley	1.18E-05	6.71E-04	4.06E-04
Climate Zone 5: West	6.68E-06	2.81E-04	6.69E-05

Alternate Approach (No Duct Leakage Testing)

The following savings tables are provided for projects implemented without performing leakage testing, accounting for the application of pre-retrofit leakage caps to non hard-to-reach (HTR) projects. The annual energy and summer and winter peak demand savings to be claimed according to the alternate approach for this measure shall be taken from Table 2-43 through Table 2-45 for the climate zone in which the project was implemented and the type of heating equipment in the project home.

NOTE: This approach is only available to programs with an incentive structure that does not vary by leakage category.

Hard-to-Reach (HTR) and Targeted Low Income Programs

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Example Deemed Savings Calculation

Example 1. Using the **standard approach**, a 1,700 square foot home with a 3.5-ton central air conditioner and a gas furnace in Climate Zone 3 is found to have a pre-retrofit duct leakage rate of 600 CFM_{25}. After sealing leaks, duct leakage is estimated at 100 CFM_{25}. The project is completed in a non-HTR program.

$$Max\ Initial\ Leakage\ Rate = \left(400\frac{CFM}{ton} \times 3.5 tons\right) \times 35\% = 490\ CFM_{25}$$

$$Reported\ Initial\ Leakage = Min(600, 490) = 490\ CFM_{25}$$

$$DL_{pre} - DL_{post} = (490 - 100) = 390\ CFM_{25}$$

$$kWh\ savings = (1.23 + 0.02) \times 390 = 488\ kWh$$

$$Summer\ kW\ savings = 1.06 \times 10^{-3} \times 390 = 0.41\ kW$$

$$Winter\ kW\ savings = 8.60 \times 10^{-6} \times 390 = 0.003\ kW$$

Example 2. Using the **alternative approach**, a duct sealing project is completed on a home of any square footage with a central heat pump of any tonnage in Climate Zone 3. The duct system is categorized as 50-90% in conditioned space with an existing duct insulation value of R4-R7 and substantial leaks. Therefore, that home is categorized as an average leakage home. No leakage testing is performed. The project is completed in an HTR program. All savings are taken directly from deemed savings lookup tables.

$$kWh\ savings = 484 + 102 = 586\ kWh$$

$$Summer\ kW\ savings = 0.42\ kW$$

$$Winter\ kW\ savings = 0.20\ kW$$

Additional Calculators and Tools

There is a calculator to estimate the energy and demand savings associated with this measure using the algorithms described in the previous subsection.

Measure Life and Lifetime Savings

The estimated useful life (EUL) for a duct sealing measure is 18.0 years.

This value is consistent with the EUL reported in the 2014 California Database for Energy Efficiency Resources (DEER).[134]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Heating type (gas, resistance heat, heat pump)
- Cooling capacity of home HVAC units (tons)
- EESPs Claiming Savings According to Duct Leakage Testing:
    - Pre-improvement duct leakage at 25 Pa (cu. ft./min)
    - Post-improvement duct leakage at 25 Pa (cu. ft./min)
- EESPs Claiming Savings without Performing Leakage Testing should provide:
    - Description of the initial assessment of leakage in the home (low, average, or high)
    - Description of location and condition of ducts:
        - Duct location (>90% conditioned, 50-90% conditioned, <50% conditioned)
        - Existing duct insulation value (>R7, R4-R7, <R4)
    - Leakage characteristics (some observable leaks, substantial leaks, catastrophic leaks)
    - Other relevant details that may assist with validating claimed leakage category (recommended)
    - Description and photos of interventions taken (both pre and post condition), such as newly sealed joints, supply vents, and other relevant leaks sealed

Document Revision History

Table 2-76: Residential Duct Efficiency Improvements Revision History

TRM Version	Date	Description of Change
v1.0	11/25/2013	TRM v1.0 origin.
v2.0	4/18/2014	TRM v2.0 update. Minor formatting changes, and language introduced to provide further direction for low-income customers and testing procedure. Contractors now required to track cooling capacity of HVAC equipment. Language added to reflect updates to federal standards for central heat pumps and central air conditioners.
v2.1	1/30/2015	TRM v2.1 update. Addition of language referring contractors to program manuals for information regarding health and safety precautions.
v3.0	4/10/2015	TRM v3.0 update. No revision.
v3.1	11/05/2015	TRM v3.1 update. Update of reference sources for air temperatures and densities, heating degree-days. Cooling demand savings required to be claimed.
v4.0	10/10/2016	TRM v4.0 update. Approach changed from algorithm-based to deemed savings coefficients estimated using building simulation models. Updated energy and demand savings. Added separate savings for homes with evaporative cooling. Updated measure description to eliminate eligibility for homes without a central AC, but with a ducted heating system.
v5.0	10/2017	TRM v5.0 update. Remove PY 2017 option to use energy and demand adjustment factors in combination with algorithm methodology from TRM v3.1. Added alternative approach to bypass the need to complete leakage testing in guidance memo to follow.
v6.0	11/2018	TRM v6.0 update. Added alternative approach to bypass the need to complete leakage testing in guidance memo to follow.

2.2.3 Central Air Conditioners Measure Overview

TRM Measure ID: R-HV-AC

Market Sector: Residential

Measure Category: HVAC

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout, new construction, early retirement

Program Delivery Type(s): Prescriptive, direct install (early retirement)

Deemed Savings Type: Look-up tables

Savings Methodology: Engineering spreadsheets and estimates

Measure Description

Residential replacement of an existing central air conditioning system with a new central air conditioning system in an existing building, or the installation of a new central air conditioning system in a new residential construction. Downsized systems that are right-sized per a heat load calculation are also eligible. A new central air conditioning system includes an entire packaged unit, or a split system consisting of an indoor unit with a matching remote condensing unit. This measure also applies to the installation of mini-split or DC inverter air conditioners that meet all existing measure eligibility criteria.

Eligibility Criteria

Newly installed units must have a cooling capacity of less than 65,000 Btu/hour (5.4 tons) to be eligible for these deemed savings.

Equipment shall be properly sized to dwelling based on ASHRAE or ACCA Manual J standards. Manufacturer data sheets on installed air conditioning equipment or AHRI reference numbers must be provided. Savings should be calculated using rated capacities whenever possible. Reported system capacities and efficiencies should always match those verified by AHRI as tested under AHRI operating conditions for a specific combination of equipment, including condenser, coil, and furnace (or condenser only for packaged units). Savings should never be calculated using efficiency ratings for individual system components.

For early retirement or rightsizing projects, attempt to determine the rated capacity of the existing unit. The rated capacity may be found on the manufacturer specification sheet for the existing unit if AHRI is not available. If the model number of the existing unit is unobtainable or if the manufacturer specification sheet cannot be found, use nominal tonnage for both the existing and new unit. Never use nominal tonnage for the existing unit in combination with rated tonnage for the new unit, which can lead to overstated savings. Additionally, never use nominal tonnage to determine savings for projects where no early retirement or rightsizing has occurred.

For early retirement projects, in order to receive savings, the unit to be replaced must be functioning at the time of removal with a maximum age of 24 years. Otherwise claim savings for a replace on burnout project.

Replacement of an evaporative cooler with a central air conditioner is eligible where the decision to change equipment types predates or is independent of the decision to install efficient equipment and should be claimed against the new construction baseline.

New construction projects are not eligible to receive deemed savings for system rightsizing.[135] For system upsizing, savings should generally be claimed against the new construction baseline. However, when upsizing while going from a single larger capacity system to multiple smaller capacity systems, savings may be claimed against the applicable replace-on-burnout or early retirement baseline if the total pre and post tonnage are within ½ ton.[136] For this scenario, savings must be looked up using the lower pre-tonnage. If the multiple installed units do not share the same efficiency value, savings should be looked up using the most conservative efficiency value.

When replacing a single unit with multiple units where the capacity is the same or has been downsized, savings should be looked up using the total system pre and post capacities. Again, if the multiple installed units do not share the same efficiency value, savings should be looked up using the most conservative efficiency value.

Baseline Condition

New construction baseline efficiency values for air conditioners are compliant with the current federal standard,[137] effective January 1, 2015. The baseline is assumed to be a new air conditioner system with an AHRI-listed SEER rating of 14.0. This baseline is also applicable to central air conditioner installations replacing room/window air conditioners or evaporative coolers.

For replace-on-burnout (ROB) projects, the baseline is reduced to 13.08 SEER. This value incorporates an adjustment to the baseline SEER value to reflect the percentage of current non-program replacements that do not include the installation of an AHRI-matched system.[138]

135 For projects using a custom baseline see TRMv6.0 Volume 4.

136 This exception is allowed to account for efficiency improvements due to zoning that are not reflected in the current savings methodology.

137 DOE minimum efficiency standard for residential air conditioners/heat pumps. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/75.

138 Frontier Associates on behalf of the Electric Utility Marketing Managers of Texas (EUMMOT). "Petition to revise Existing Commission-Approved Deemed Savings Values for Central Air Conditioning and Heat Pump Systems: Docket No. 36780." Public Utility Commission of Texas. Approved August 27, 2009. http://interchange.puc.state.tx.us/WebApp/Interchange/application/dbapps/filings/pgSearch.asp. Adapted for new 14 SEER baseline.

For early retirement (ER) projects, the cooling baseline is reduced to 10 SEER for systems installed before January 23, 2006. For systems installed on or after January 23, 2006, the ER baseline increases to 12.44[139] SEER.

Table 2-77: Central Air Conditioner Baseline Efficiencies

Project Type	Cooling Mode
New construction	14.00 SEER
Replace-on-burnout	13.08 SEER
Early retirement (as of 1/23/2006)	12.44 SEER
Early retirement (before 1/23/2006)	10.00 SEER

High-Efficiency Condition

Table 2-78 displays the Consortium for Energy Efficiency (CEE) requirements for eligible Tier 1 air conditioners as of January 1, 2009. Energy efficiency service providers are expected to comply with the latest CEE Tier 1 requirements.

Table 2-78: Central Air Conditioner CEE Tier 1 Requirements

SEER	EER
14.5	12.0

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

New Construction and Replace-on-Burnout

Energy and summer demand savings were estimated using air conditioner performance curves developed by the National Renewable Energy Laboratory[140] for typical units in each of the following SEER ranges:

- Baseline units
- 14.5–14.9
- 15.0–15.9
- 16.0–16.9
- 17.0–17.9
- 18.0–20.9
- 21.0 and above

[139] Refer to Texas TRM 2.1 for savings using 12.44 SEER baseline.

[140] D. Cutler et al., Improved Modeling of Residential Air Conditioners and Heat Pumps for Energy Calculations. National Renewable Energy Laboratory. NREL/TP-5500-56354. January 2013. Tables 12 and 13. http://www.nrel.gov/docs/fy13osti/56354.pdf.

14.5–16.9 SEER units were assumed to be single stage. 17.0 SEER and above units were assumed to be multi-stage.

These performance curves provide the capacity and efficiency of the air conditioners operating in cooling mode across a wide range of outside air temperatures. Unit loading was estimated as a function of outside air temperature and hours of cooling mode operation under different loadings, which were estimated using bin weather data for each weather zone.

Summer demand savings were estimated according to the expected unit performance under design conditions. The Air Conditioning Contractors of America's (ACCA) Manual S recommends that residential air conditioners be sized at 115 percent of the maximum cooling requirement of the house. Therefore, for all weather zones, it is assumed that typical HVAC systems are sized to 115 percent of their design cooling load (oversized by 15 percent). Air conditioner system output was then compared to its loading under design conditions.

The model uses the following set of normalized performance curves to scale the rated performance values as a function of outdoor dry-bulb temperature ranging from 65 to 115 degrees Fahrenheit. The total capacity and Energy Input Ratio (EIR = 1/COP) curves are a function of entering wet-bulb temperature (EWB) and outdoor dry-bulb temperature (ODB) and are both quadratic curve fits of the form:

$$y = a + b \times T_{EWB} + c \times T_{EWB}^2 + d \times T_{ODB} + e \times T_{ODB}^2 + f \times T_{EWB} \times T_{ODB}$$

Equation 54

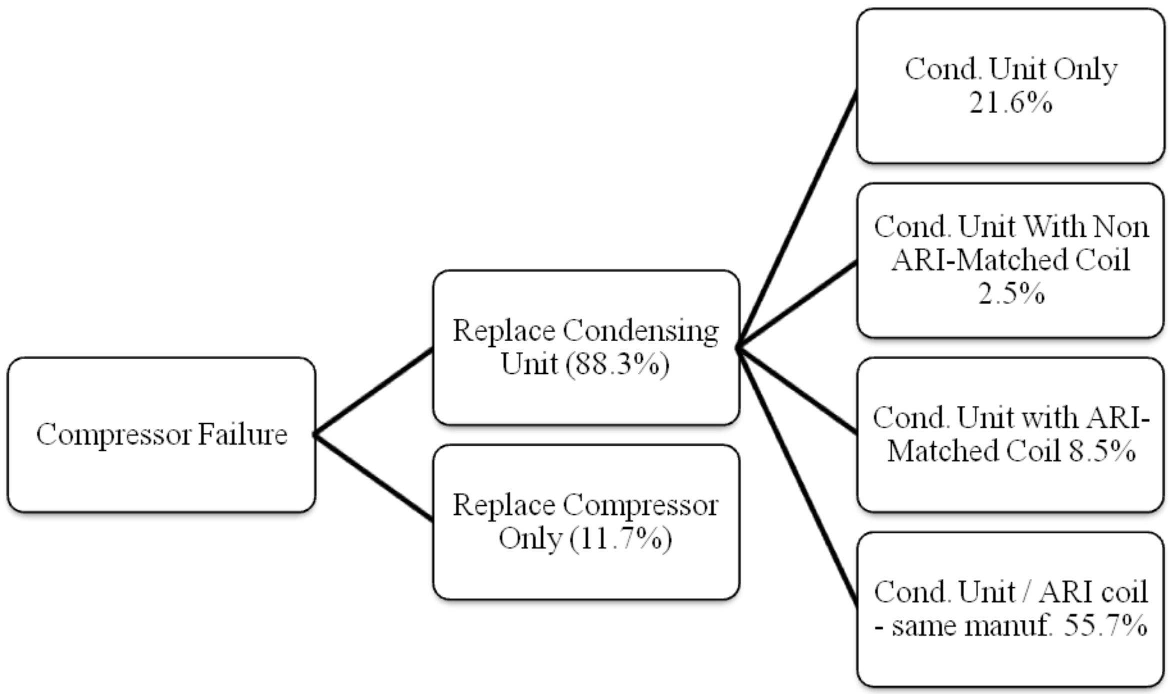
c	-0.001056996	-0.001272755	-0.00073335
d	-0.012573945	-0.019956043	-0.009062553
e	0.000214638	0.000256512	0.000165099
f	-0.000145054	-0.000133539	-0.0000997

To estimate the baseline SEER value for retrofit installations, Texas A&M's Energy Systems Laboratory (ESL) surveyed dealers across the State to determine installation practices. The research found that in the event of a compressor failure out of warranty, dealers replaced the compressor 11.7 percent of the time, and replaced the condensing unit 88.3 percent of the time. Further, the condensing unit replacements consist of condensing unit-only replacements, replacements with mismatched evaporator coils, and replacements with matching evaporator coils. The percentages for these installations are as follows:

Figure 2-1: Unit Replacement Percentages Upon Compressor Failure



Source: Docket No. 36780

To calculate a weighted average SEER for these installations, ESL assumed that a compressor-only replacement resulted in no increase in SEER, and that the SEER of a condensing unit installed without a matching coil would be 85 percent of the SEER value for a matched system. The ESL estimate of the baseline SEER for replacement AC units is given by the following equation:

$$\begin{aligned} \boldsymbol{SEER_{Base}} = & \left(\boldsymbol{SEER_{Compressor\ Replacement}}\right) \times (\boldsymbol{Actual\ \%\ Compressor\ Replacement}) \\ & + \left(\boldsymbol{SEER_{Condenser\ Replacement}}\right) \times (\boldsymbol{Actual\ \%\ Condenser\ Replacement}) \\ & + \left(\boldsymbol{SEER_{System\ Replacement}}\right) \times (\boldsymbol{Actual\ \%\ System\ Replacement}) \end{aligned}$$

Equation 55

Substituting ESL SEER estimates and survey data provides the following baseline SEER estimate:

$$SEER_{Base} = (9.5) \times (11.7\%) + (11.05) \times (24.1\%) + (13.5) \times (64.2\%) = 12.44$$

Adjusting for the increased 14 SEER baseline:

$$SEER_{Base} = (10.5) \times (11.7\%) + (11.9) \times (24.1\%) + (14) \times (64.2\%) = 13.08$$

In new construction, there is no possibility of a partial system (e.g. condensing unit-only) change out, so the 13.08 baseline would not be appropriate. Therefore, the baseline for new construction installations is set at the federal government's minimum efficiency standard of 14 SEER.

Early Retirement

Annual energy (kWh) and summer peak demand (kW) savings must be calculated separately for two time periods:

1. The estimated remaining life of the equipment that is being removed, designated the remaining useful life (RUL), and
2. The remaining time in the EUL period (18—RUL)

Annual energy and summer peak demand savings are calculated by weighting the early retirement and replace-on-burnout savings by the RUL of the unit and the remainder of the EUL period, as outlined in the Volume 3 appendices.

Where:

RUL = *Remaining Useful Life (see Table 2-81); if unknown, assume the age of the replaced unit is equal to the EUL resulting in a default RUL of 7.0 years. If individual system components were installed at different times, use the condenser age as a proxy for the entire system. Default RUL may be used exclusively if applied consistently for all projects. Otherwise, the default should only be used when a project is reported and documented as having a nameplate that is illegible.*

EUL = *Estimated Useful Life = 18 years*

Table 2-81: Remaining Useful Life of Replaced Unit

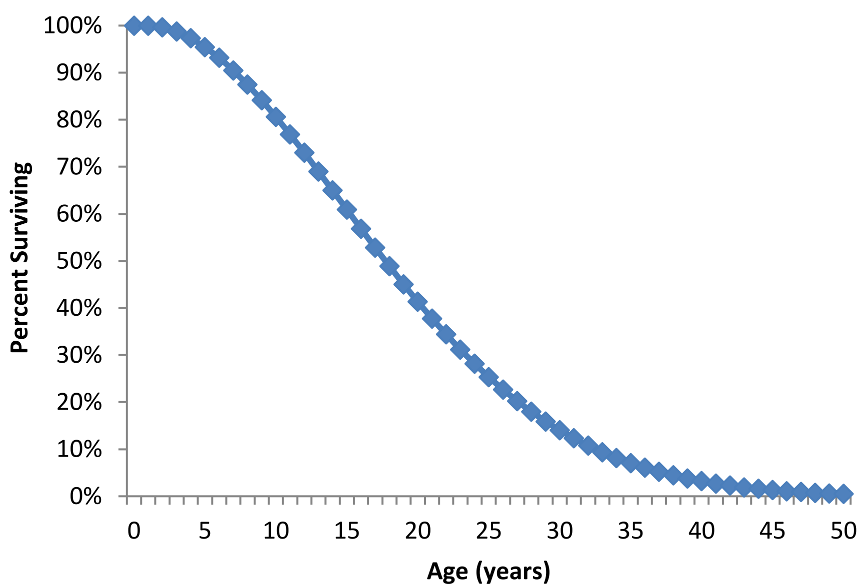
Age of Replaced Unit (Years)	Remaining Useful Life (Years)	Age of Replaced Unit (Years)	Remaining Useful Life (Years)
1	16.8	14	8.6
2	15.8	15	8.2
3	14.9	16	7.9
4	14.1	17	7.6
5	13.3	18	7.0
6	12.6	19	6.0
7	11.9	20	5.0
8	11.3	21	4.0
9	10.8	22	3.0
10	10.3	23	2.0

Age of Replaced Unit (Years)	Remaining Useful Life (Years)	Age of Replaced Unit (Years)	Remaining Useful Life (Years)
11	9.8	24	1.0
12	9.4	25[141,142]	0.0
13	9.0		

Derivation of RULs

Central air conditioners have an estimated useful life of 18 years. This estimate is consistent with the age at which approximately 50 percent of the central air conditioners installed in a given year will no longer be in service, as described by the survival function in Figure 2-2.

Figure 2-2: Survival Function for Central Air Conditioners[143]



The method for estimating the remaining useful life (RUL). of a replaced system uses the age of the existing system to re-estimate the projected unit lifetime based on the survival function shown in Figure 2-2. The age of the central air conditioner being replaced is found on the horizontal axis, and the corresponding percentage of surviving air conditioners is determined

141 RULs are capped at the 75th percentile of equipment age, 25 years, as determined based on DOE survival curves (see Figure 2-2). Systems older than 25 years should use the ROB baseline. See the January 2015 memo, "Considerations for early replacement of residential equipment," for further detail.

142 Ward, B., Bodington, N., Farah, H., Reeves, S., and Lee, L. "Considerations for early replacement of residential equipment." Prepared by the Evaluation, Measurement, and Verification (EM&V) team for the Electric Utility Marketing Managers of Texas (EUMMOT). January 2015. This document has been made available to Texas investor-owned utilities through the EM&V team's SharePoint.

143 Department of Energy, Federal Register, 76 FR 37408, Technical Support Document: 8.2.3.5 Lifetime. June 2011. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/75. Download TSD at: http://www.regulations.gov/#!documentDetail;D=EERE-2011-BT-STD-0011-0012.

from the chart. The surviving percentage value is then divided in half, creating a new estimated useful lifetime applicable to the current unit age. The age (year) that corresponds to this new percentage is read from the chart. RUL is estimated as the difference between that age and the current age of the system being replaced.

Deemed Energy Savings Tables[144]

Table 2-82 through Table 2-86 present the energy savings (kWh) associated with central air conditioners installed in new homes. Table 2-87 through Table 2-91 present energy savings associated with replace-on-burnout of central air conditioners. Table 2-92 through Table 2-101 present energy savings associated with early retirement of central air conditioners.

New Construction

Table 2-82 through Table 2-86 present the energy savings (kWh) associated with central air conditioners installed during new construction (14.0 SEER baseline) for the five Texas climate zones.

Replace-on-Burnout

Table 2-87 through Table 2-91 present the energy savings (kWh) associated with central air conditioners installed in replace-on-burnout homes (13.08 SEER baseline) for the five Texas climate zones. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Early Retirement

Table 2-92 through Table 2-101 present the early retirement energy savings (kWh) associated with central air conditioners installed in homes for the five Texas climate zones. These savings can be used with the replace-on-burnout energy savings in Table 2-107 through Table 2-111 to calculate annual savings. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Deemed Summer Demand Savings Tables[145]

Air conditioners 17 SEER or greater are assumed to be two-stage air conditioners, while those under 17 SEER are assumed to be single-stage air conditioners. This results in slightly lower summer demand savings for 17.0-17.9 SEER air conditioners as compared to 16.0-16.9 SEER units.

New Construction

Table 2-102 through Table 2-106 present the summer demand savings (kW) associated with central air conditioners installed during new construction (14.0 SEER baseline) for the five Texas climate zones.

Climate Zone 1: Panhandle Region, Amarillo Weather Data

Table 2-102: Summer Demand Savings for 14.0 SEER New Construction Baseline—Zone 1

Size (Btuh)	SEER Range

Replace-on-Burnout

Table 2-107 through Table 2-111 present the summer demand savings (kW) associated with central air conditioners installed in replace-on-burnout homes (13.08 SEER baseline) for the five Texas climate zones. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Early Retirement

Table 2-112 through Table 2-121 present the early retirement summer demand savings (kW) associated with central air conditioners installed in homes for the five Texas climate zones. These savings can be used with the replace-on-burnout energy savings in Table 2-107 through Table 2-111 to calculate summer demand savings. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) of a central air conditioning unit is 18 years based on the current DOE Final Rule standards for central air conditioners.[146]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Decision/action type (early retirement, replace-on-burnout, new construction)
- Cooling capacity of the installed unit (tons)
- Seasonal Energy Efficiency Ratio (SEER) and Energy Efficiency Ratio (EER) of the installed unit
- Age of replaced unit (Early Retirement only)
- Retired unit model number, serial number, manufacturer, and cooling capacity (Early Retirement or Rightsizing)
- Photograph of retired unit nameplate (Early Retirement or Rightsizing)
- If photograph of retired unit nameplate is unavailable or not legible, provide a photo and/or description documenting the reason why the nameplate photo was unobtainable (Early Retirement only)
- If photograph of retired unit nameplate is unavailable or not legible, provide estimated square footage of conditioned area served by the retired unit (Rightsizing only)
- Photograph demonstrating functionality of existing equipment and/or customer responses to survey questionnaire documenting the condition of the replaced unit and their motivation for measure replacement for early retirement eligibility determination (Early Retirement only)
- If replacing an evaporative cooler, application should include a statement that the customer decision to change equipment types predates or is independent of the decision to install efficient equipment

2.2.4 Ground Source Heat Pumps Measure Overview

TRM Measure ID: R-HV-GH

Market Sector: Residential

Measure Category: HVAC

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout, new construction

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure requires the installation of a ground-source heat pump (GSHP) meeting the minimum requirements of ENERGY STAR® Tier 3 geothermal heat pump key product criteria. The deemed savings are dependent upon the energy efficiency rating (EER) and coefficient of performance (COP) of the installed equipment. Savings calculations are presented for systems both with and without desuperheaters.

Eligibility Criteria

The deemed savings apply to units with a capacity of ≤ 65,000 Btu/hour.

Energy savings for desuperheaters only apply if the desuperheater is attached to an electric storage water heater. The electric storage water heating cannot replace a gas water heater in a retrofit installation.

Baseline Condition

The baseline unit is assumed to be an air-source heat pump (ASHP) for new construction, and either an ASHP or an electric resistance furnace for replace-on-burnout projects. New construction baseline efficiency values for ASHPs are compliant with the current federal minimum standard,[148] effective January 1, 2015.

[148] DOE minimum efficiency standard for residential air conditioners/heat pumps. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/75.

For replace-on-burnout (ROB) projects, the cooling baseline is reduced to 13.08 SEER. This value incorporates an adjustment to the baseline SEER value to reflect the percentage of current replacements that do not include the installation of an AHRI-matched system.[149] The heating baseline for replace-on-burnout projects is dependent on the heating type of the baseline equipment.

Table 2-123: Ground Source Heat Pump Baseline Efficiencies

Project Type	Cooling Mode[150]	Heating Mode[151]
New Construction	11.8 EER (14 SEER)	2.4 COP (8.2 HSPF)
ROB—Air Source Heat Pump Baseline	11.4 EER (13.08 SEER)	2.4 COP (8.2 HSPF)
ROB—Electric Resistance Baseline		1 COP (3.41 HSPF)

High-Efficiency Condition

Table 2-124 displays the ENERGY STAR® requirements for eligible Tier 3 geothermal heat pumps as of January 1, 2012. Energy efficiency service providers are expected to comply with the latest ENERGY STAR® requirements.

Table 2-124: Ground Source Heat Pump ENERGY STAR® Tier 3 Requirements

Product Type	Cooling Mode (EER)	Heating Mode (COP)
Closed Loop Water-to-Air	17.1	3.6
Open Loop Water-to-Air	21.1	4.1
Closed Loop Water-to-Water	16.1	3.1
Open Loop Water-to-Water	20.1	3.5
Direct Geoexchange (DGX)	16.0	3.6

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Peak demand and annual energy savings for GSHP systems should be calculated as shown below. Where a desuperheater is also installed, please see the Deemed Energy Savings Tables section for additional energy savings, and the Deemed Summer Demand Savings Tables for additional demand savings.

Energy and demand savings for desuperheaters were adapted from a 2001 study conducted by Oak Ridge National Laboratory (ORNL) on ground source heat pumps in Texas.[153] Desuperheater savings were calculated for each climate zone by taking the difference in savings between GSHPs with and without desuperheaters and averaging the savings between low and high efficiency units. Savings for GSHP systems with desuperheaters should be calculated using the algorithms below with an additional energy credit based on the system capacity and efficiency.

The ORNL study draws from a 1998 analysis based on a study conducted at the Fort Polk Joint Readiness Training Center in Leesville, Louisiana. The Fort Polk study used calibrated simulations of 200 multifamily residences in the complex to estimate energy savings attributable to replacement of air source heat pumps with ground source heat pumps. These estimates were found to be within 5 percent of actual post-retrofit savings. Building models were developed using TRNSYS.[154]

Using the Fort Polk models, the ORNL study assumed a baseline of a 1.5 ton, 10 SEER air source heat pump. Simulations of low-, medium-, and high-efficiency ground source heat pumps with and without desuperheaters were compared against the baseline unit. The models were run using TMY-2 weather profiles for climate zones 1-4. Energy and demand differences between the pre- and post-retrofit models were used to estimate average savings per ton of cooling capacity.

In the 1998 analysis, low-efficiency GSHPs were assumed to be units with an EER of 12.4 and capacity of 19 kBtuh, while medium-efficiency units had an EER of 16.8 and capacity of 21 kBtuh. High-efficiency units had an EER or 18.3, with a capacity of 22 kBtuh.

[153] Shonder, J. A., Hughes, P., and Thornton, J. Development of Deemed Energy and Demand Savings for Residential Ground Source Heat Pump Retrofits in the State of Texas. Transactions-American Society of Heating, Refrigerating, and Air Conditioning Engineers. 108, no. 1: 953-961, 2001. http://web.ornl.gov/~webworks/cppr/y2001/pres/112677.pdf.

[154] Klein, S. A. TRNSYS Manual: A Transient Simulation Program. Solar Engineering Laboratory, University of Wisconsin-Madison, Version 14.2 for Windows, September 1996.

These models were used to derive the energy and demand savings associated with installation of a desuperheater along with a ground source heat pump, as shown in Table 2-127 and Table 2-128, respectively.

Energy Savings Algorithms

$$kWh_{Savings} = kWh_{Savings,Summer} + kWh_{Savings,Winter} + kWh_{desuperheater}$$

Equation 58

$$kWh_{Savings,C} = CAP_C \times \frac{1\ kW}{1{,}000\ W} \times EFLH_C \times \left(\frac{1}{SEER_{Base}} - \frac{1}{EER_{GSHP}}\right)$$

Equation 59

$$kWh_{Savings,H} = CAP_H \times \frac{1\ kWh}{1{,}000\ Wh} \times EFLH_H \times \left(\frac{1}{HSPF_{Base}} - \frac{1}{3.412 \times COP_{GSHP}}\right)$$

Equation 60

Where:

$kWh_{desuperheater}$ = *Energy savings (kWh) associated with installation of a desuperheater (see Table 2-127). These savings should only be added if a desuperheater is installed.*

CAP_C = *Rated equipment cooling capacity of the installed GSHP (Btu/hr)*

CAP_H = *Rated equipment heating capacity of the installed GSHP (Btu/hr)*

$EFLH_C$ = *Equivalent full load hours for cooling)*

$EFLH_H$ = *Equivalent full load hours for heating (Table 2-125)*

$SEER_{Base}$ = *Seasonal Energy Efficiency Ratio of the baseline cooling equipment (Table 2-123)*

EER_{GSHP} = *Energy Efficiency Ratio of the installed GSHP*

$HSPF_{Base}$ = *Heating Seasonal Performance Factor of the baseline heating equipment (Table 2-123)*

COP_{GSHP} = *Coefficient of Performance of the installed GSHP*

Table 2-125: Equivalent Full Load Cooling/Heating Hours[155]

Climate Zone	$EFLH_C$	$EFLH_H$
Climate Zone 1: Panhandle	1,142	1,880
Climate Zone 2: North	1,926	1,343
Climate Zone 3: South	2,209	1,127
Climate Zone 4: Valley	2,958	776
Climate Zone 5: West	1,524	1,559

Demand Savings Algorithms

$$kW_{Savings,C} = CAP_C \times \frac{1\ kW}{1{,}000\ W} \times \left(\frac{1}{EER_{Base}} - \frac{1}{EER_{GSHP}}\right) \times CF_C + kW_{desuperheater}$$

Equation 61

$$kW_{Savings,H} = CAP_H \times \frac{1\ kWh}{3{,}412\ Btu} \times \left(\frac{1}{COP_{Base}} - \frac{1}{COP_{GSHP}}\right) \times CF_H$$

Equation 62

Where:

CAP_C	=	*Rated equipment cooling capacity of the installed GSHP (Btu/hr)*
CAP_H	=	*Rated equipment heating capacity of the installed GSHP (Btu/hr)*
EER_{Base}	=	*Energy Efficiency Ratio of the baseline cooling equipment (Table 2-123)*
EER_{GSHP}	=	*Energy Efficiency Ratio of the installed GSHP*
COP_{Base}	=	*Coefficient of Performance of the baseline heating equipment (Table 2-123)*
COP_{GSHP}	=	*Coefficient of Performance of the installed GSHP*
CF_C	=	*Coincidence Factor = (Table 2-4)*
CF_H	=	*Coincidence Factor = (Table 2-4)*
$kW_{desuperheater}$	=	*Summer demand savings (kW) associated with installation of a desuperheater (see Table 2-128). These savings should only be added if a desuperheater is installed.*

This section is not applicable.

[156] See Volume 1, Appendix B.

Measure Life and Lifetime Savings

The estimated useful life (EUL) of a high-efficiency ground source heat pump unit is 20 years.

This value is consistent with the EUL reported in the Department of Energy GSHP guide.[157]

Program Tracking Data and Evaluation Requirements

It is required that the following list of primary inputs and contextual data be specified and tracked by the program database to inform the evaluation and apply the savings properly:

- Climate zone
- Decision/action type (new construction, replace-on-burnout)
- Replaced unit type (heat pump, electric resistance)
- Cooling and heating capacity (Btu/hr)
- Energy Efficiency Ratio (EER) of the unit installed
- Coefficient of Performance (COP) of the unit installed
- Whether a desuperheater was also installed or present

2.2.5 Central Heat Pumps Measure Overview

TRM Measure ID: R-HV-HP

Market Sector: Residential

Measure Category: HVAC

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout, new construction, early retirement

Program Delivery Type(s): Prescriptive, direct Install (early retirement)

Deemed Savings Type: Look-up tables

Savings Methodology: Engineering spreadsheets and estimates

Measure Description

Residential replacement of existing heating and cooling equipment with a new central air-source heat pump in an existing building, or the installation of a new central heat pump in a new residential construction. Downsized systems that are right-sized per a heat load calculation are also eligible. A new central heat pump includes an entire packaged unit, or a split system consisting of an indoor unit with a matching remote condensing unit. This measure also applies to the installation of mini-split, DC inverter, or dual-fuel heat pumps that meet all existing measure eligibility criteria.

All measure installation standards and baseline data from the central air conditioner measure shall apply to the heat pump measure.

Eligibility Criteria

Newly installed units must have a cooling capacity of less than 65,000 Btu/hour (5.4 tons) to be eligible for these deemed savings. Gas furnaces are not eligible to be awarded savings for replacement through this measure.

Equipment shall be properly sized to dwelling based on ASHRAE or ACCA Manual J standards. Manufacturer data sheets on installed heat pump equipment or AHRI reference numbers must be provided. Savings should be calculated using rated capacities whenever possible. Reported system capacities and efficiencies should always match those verified by AHRI as tested under AHRI operating conditions for a specific combination of equipment, including condenser, coil, and furnace (or condenser only for packaged units). Savings should never be calculated using efficiency ratings for individual system components.

For early retirement or rightsizing projects, attempt to determine the rated capacity of the existing unit. The rated capacity may be found on the manufacturer specification sheet for the existing unit if AHRI is not available. If the model number of the existing unit is unobtainable or if the manufacturer specification sheet cannot be found, use nominal tonnage for both the existing and new unit. Never use nominal tonnage for the existing unit in combination with rated tonnage for the new unit, which can lead to overstated savings. Additionally, never use nominal tonnage to determine savings for projects where no early retirement or rightsizing has occurred.

For early retirement projects, in order to receive savings, the unit to be replaced must be functioning at the time of removal with a maximum age of 20 years. Otherwise claim savings for a replace on burnout project.

Replacement of an evaporative cooler with a central heat pump is eligible where the decision to change equipment types predates or is independent of the decision to install efficient equipment and should be claimed against the new construction baseline.

New construction projects are not eligible to receive deemed savings for system rightsizing.[158] For system upsizing, savings should generally be claimed against the new construction baseline. However, when upsizing while going from a single larger capacity system to multiple smaller capacity systems, savings may be claimed against the applicable replace-on-burnout or early retirement baseline if the total pre and post tonnage are within ½ ton.[159] For this scenario, savings must be looked up using the lower pre-tonnage. If the multiple installed units do not share the same efficiency value, savings should be looked up using the most conservative efficiency value.

When replacing a single unit with multiple units where the capacity is the same or has been downsized, savings should be looked up using the total system pre and post capacities. Again, if the multiple installed units do not share the same efficiency value, savings should be looked up using the most conservative efficiency value.

Baseline Condition

New Construction, Replace-on-Burnout, or Early Retirement of an Air-Source Heat Pump

New construction baseline efficiency values for heat pumps are compliant with the current federal minimum standard,[160] effective January 1, 2015. The baseline is assumed to be a new heat pump system with an AHRI-listed SEER rating of 14.0. This baseline is also applicable to central heat pump installations replacing air conditioners with central gas heat, evaporative coolers with central, space, or no heating, or room/window air conditioners with central, space, or no heating.

---

158 For projects using a custom baseline see TRMv6.0 Volume 4.

159 This exception is allowed to account for efficiency improvements due to zoning that are not reflected in the current savings methodology.

160 DOE minimum efficiency standard for residential air conditioners/heat pumps. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/75.

For replace-on-burnout (ROB) projects, the cooling baseline is reduced to 13.08 SEER. This value incorporates an adjustment to the baseline SEER value to reflect the percentage of current replacements that do not include the installation of an AHRI-matched system.[161]

For early retirement (ER) projects, the cooling baseline is reduced to 10 SEER for systems installed before January 23, 2006. For systems installed on or after January 23, 2006, the ER baseline increases to 12.44 SEER.

For ROB projects, heating baseline efficiency values for heat pumps are compliant with the current federal minimum standard, effective January 1, 2015. These standards specify an HSPF of 8.2 for split systems, or 8.0 for packaged systems. This baseline reflects updates to federal standards that take effect January 1, 2015, as defined in the Department of Energy (DOE) energy efficiency standards (10 CFR Part 430).[162] For ER projects where the existing system was installed on or after January 23, 2006, the heating baseline efficiency is assumed to be an HSPF of 7.7 based on the federal minimum standard in effect from January 23, 2006 through December 31, 2014.[163] For ER projects where the existing system was installed before January 23, 2006, the heating baseline efficiency is reduced to 6.8 HSPF based on the federal minimum standard in effect prior to January 23, 2006.

Replace-on-Burnout or Early Retirement of an Electric Resistance Furnace

By the nature of the technology, all electric resistance furnaces have the same efficiency with HSPF = 3.41.[164] Projects in which an electric resistance furnace is replaced, either in replace-on-burnout or early retirement scenarios, use this baseline for heating-side savings.

For ROB projects, cooling savings are the same as for new construction and ROB of an air-source heat pump. For early retirement (ER) projects, the cooling baseline is reduced to 10 SEER for systems installed before January 23, 2006. For systems installed on or after January 23, 2006, the ER baseline increases to 12.44 SEER.

[163] Ibid.

[164] COP = HSPF × 1,055 J/BTU / 3,600 J/W-hr. For Electric Resistance, heating efficiency is 1 COP. Therefore, HSPF = 1 × 3,600 / 1,055 = 3.41.

Table 2-130: Central Heat Pump Baseline Efficiencies

Project Type	Cooling Mode	Heating Mode
New construction	14 SEER	8.2 HSPF
Replace-on-burnout, heat pump	13.08 SEER	8.2 HSPF
Replace-on-burnout, electric resistance furnace		3.41 HSPF
Early retirement, heat pump (as of 1/23/2006)	12.44 SEER	7.7 HSPF
Early retirement, electric resistance furnace (as of 1/23/2006)		3.41 HSPF
Early retirement, heat pump (before 1/23/2006)	10 SEER	6.8 HSPF
Early retirement, electric resistance furnace (before 1/23/2006)		3.41 HSPF

High-Efficiency Condition

Table 2-131 displays the Consortium for Energy Efficiency (CEE) requirements for eligible Tier 1 heat pumps as of January 1, 2009. Energy efficiency service providers are expected to at least comply with the latest CEE Tier 1 requirements.

Table 2-131: Central Heat Pump CEE Tier 1 Requirements

SEER	EER	HSPF
14.5	12.0	8.5

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Replace-on-Burnout or New Construction

Energy, summer demand, and winter demand savings were estimated using heat pump performance curves developed by the National Renewable Energy Laboratory[165] for typical units in each of the following SEER ranges:

- Baseline units
- 14.5–14.9
- 15.0–15.9
- 16.0–16.9
- 17.0–17.9
- 18.0–20.9
- 21.0 and above

[165] D. Cutler et al. Improved Modeling of Residential Air Conditioners and Heat Pumps for Energy Calculations. National Renewable Energy Laboratory. NREL/TP-5500-56354. January 2013. Tables 12 and 13. http://www.nrel.gov/docs/fy13osti/56354.pdf

14.5–16.9 SEER units were assumed to be single stage. 17.0 and above SEER units were assumed to be multi-stage cooling units.

These performance curves provide the capacity and efficiency of the heat pump operating in cooling mode across a wide range of outside air temperatures. Unit loading was estimated as a function of outside air temperature, and hours of cooling mode operation under different loadings were estimated using bin weather data for each weather zone. In heating mode, predicted HVAC operation was limited to meeting 77 percent of load, using a factor applied in Manual J to correlate design load hours to equivalent full load hours under actual operating conditions. This approach accounts for the observation that heating systems are not always operated even when outdoor conditions indicate they should.

Summer and winter demand savings were estimated according to the expected unit performance under design conditions. For all weather zones, it is assumed that typical HVAC systems are sized to 115 percent of their design cooling load (oversized by 15 percent). Heating mode capacity was related to rated cooling capacity using the rated capacity in cooling and heating mode of the residential market heat pump products of four major manufacturers according to data exported from AHRI. Data were exported from the AHRI directory and the average ratio for each equipment size of heating capacity to cooling capacity was multiplied by the rated (cooling side) capacity to estimate the heat pump capacity. Heat pump system output was then compared to its loading under design conditions.

The model uses the following set of normalized performance curves to scale the rated performance values as a function of outdoor dry-bulb temperature ranging from 65 to 115 degrees Fahrenheit. The total capacity and Energy Input Ratio (EIR = 1/COP) curves are a function of entering wet-bulb temperature (EWB) and outdoor dry-bulb temperature (ODB) and are both quadratic curve fits of the form:

$$y = a + b \times T_{EWB} + c \times T_{EWB}^2 + d \times T_{ODB} + e \times T_{ODB}^2 + f \times T_{EWB} \times T_{ODB}$$

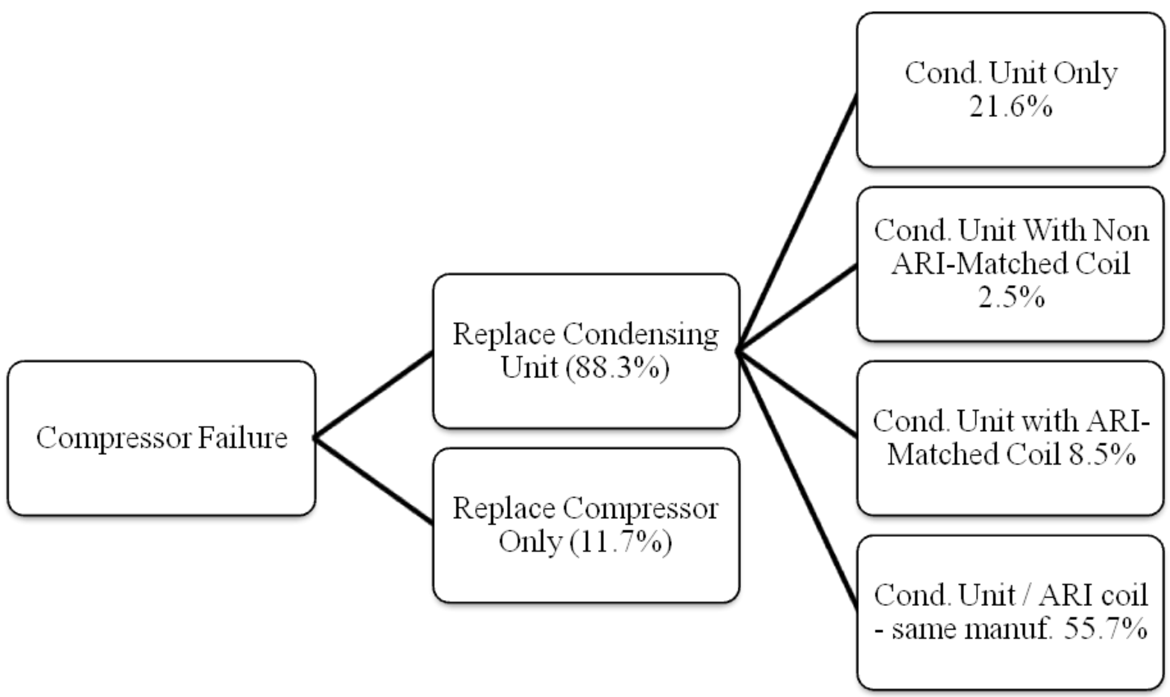
To estimate the baseline SEER value for retrofit installations, Texas A&M's Energy Systems Laboratory (ESL) surveyed dealers across the State to determine installation practices. The research found that in the event of a compressor failure out of warranty, dealers replaced the compressor 11.7 percent of the time, and replaced the condensing unit 88.3 percent of the time. Further, the condensing unit replacements consist of condensing unit-only replacements, replacements with mismatched evaporator coils, and replacements with matching evaporator coils. The percentages for these installations are as follows:

Figure 2-3: Unit Replacement Percentages upon Compressor Failure



Source: Docket No. 36780

[167] Using air conditioner capacity EIR coefficients for heat pump cooling savings.

To calculate a weighted average SEER for these installations, ESL assumed that a compressor-only replacement resulted in no increase in SEER, and that the SEER of a condensing unit installed without a matching coil would be 85 percent of the SEER value for a matched system. The ESL estimate of the baseline SEER for replacement AC units is given by the following equation:

$$\begin{aligned} SEER_{Base} = & \left(SEER_{Compressor\ Replacement}\right) \times (Actual\ \%\ Compressor\ Replacement) \\ & + \left(SEER_{Condenser\ Replacement}\right) \times (Actual\ \%\ Condenser\ Replacement) \\ & + \left(SEER_{System\ Replacement}\right) \times (Actual\ \%\ System\ Replacement) \end{aligned}$$

Equation 64

Substituting ESL SEER estimates and survey data provides the following baseline SEER estimate:

$$SEER_{Base} = (9.5) \times (11.7\%) + (11.05) \times (24.1\%) + (13.5) \times (64.2\%) = 12.44$$

Adjusting for the increased 14 SEER baseline:

$$SEER_{Base} = (10.5) \times (11.7\%) + (11.9) \times (24.1\%) + (14) \times (64.2\%) = 13.08$$

In new construction, there is no possibility of a partial system (e.g. condensing unit-only) change out, so the 13.08 baseline would not be appropriate. Therefore, the baseline for new construction installations is set at the federal government's minimum efficiency standard of 14 SEER.

Early Retirement

Annual energy (kWh) and summer peak demand (kW) savings must be calculated separately for two time periods:

1. The estimated remaining life of the equipment that is being removed, designated the remaining useful life (RUL), and
2. The remaining time in the EUL period (15—RUL)

Annual energy and summer peak demand savings are calculated by weighting the early retirement and replace-on-burnout savings by the RUL of the unit and the remainder of the EUL period, as outlined in the Volume 3 appendices.

Where:

RUL = *Remaining Useful Life (see Table 2-134); if unknown, assume the age of the replaced unit is equal to the EUL resulting in a default RUL of 6.0 years. If individual system components were installed at separate times, use the condenser age as a proxy for the entire system. Default RUL may be used exclusively if applied consistently for all projects. Otherwise, the default should only be used when a project is reported and documented as having a nameplate that is illegible. For heat pumps replacing an air conditioner with an electric resistance furnace, use the RUL table from the Central Air conditioner measure instead.*

EUL = *Estimated Useful Life = 15 years*

Table 2-134: Remaining Useful Life of Replaced Unit

Age of Replaced Unit (years)	Remaining Useful Life (years)	Age of Replaced Unit (years)	Remaining Useful Life (years)
1	13.7	12	7.9
2	12.7	13	7.6
3	12.0	14	7.0
4	11.3	15	6.0
5	10.7	16	5.0
6	10.2	17	4.0
7	9.7	18	3.0
8	9.3	19	2.0
9	8.9	20	1.0
10	8.5	21[168,169]	0.0
11	8.2		

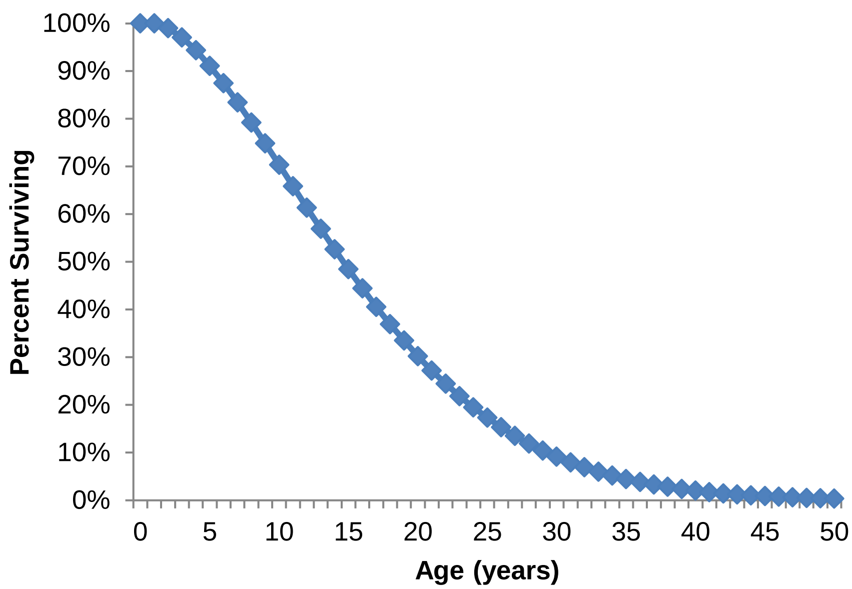
Derivation of RULs

Central heat pumps have an estimated useful life of 15 years. This estimate is consistent with the age at which approximately 50 percent of the central heat pumps installed in a given year will no longer be in service, as described by the survival function in Figure 2-4.

[168] RULs are capped at the 75th percentile of equipment age, 21 years, as determined based on DOE survival curves (Figure 2-4). Systems older than 21 years should use the ROB baseline. See the January 2015 memo, "Considerations for early replacement of residential equipment," for further detail.

[169] Ward, B., Bodington, N., Farah, H., Reeves, S., and Lee, L. "Considerations for early replacement of residential equipment." Prepared by the Evaluation, Measurement, and Verification (EM&V) team for the Electric Utility Marketing Managers of Texas (EUMMOT). January 2015. This document has been made available to Texas investor-owned utilities through the EM&V team's SharePoint.

Figure 2-4: Survival Function for Central Heat Pumps[170]



The method for estimating the remaining useful life (RUL). of a replaced system uses the age of the existing system to re-estimate the projected unit lifetime based on the survival function shown in Figure 2-4. The age of the central heat pump being replaced is found on the horizontal axis, and the corresponding percentage of surviving heat pumps is determined from the chart. The surviving percentage value is then divided in half, creating a new estimated useful lifetime applicable to the current unit age. The age (year) that corresponds to this new percentage is read from the chart. RUL is estimated as the difference between that age and the current age of the system being replaced.

Cooling, Replace-on-Burnout

Table 2-140 through Table 2-144 present the energy savings (kWh) for cooling load types associated with a central heat pump replacing on burnout an HVAC system for all five Texas climate zones. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been to change in capacity are highlighted in light blue and bold text.

Cooling, Early Retirement

Table 2-145 through Table 2-154 present the cooling energy savings (kWh) associated with the installation of a central heat pump following the early retirement of an HVAC system for all five Texas climate zones. These savings can be used with the replace-on-burnout energy savings in Table 2-140 through Table 2-144 to calculate annual cooling savings. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Heating, New Construction or Replace-on-Burnout of a Heat Pump

Table 2-155 through Table 2-159 present the energy savings (kWh) for heating load types associated with a central heat pump being installed during new construction or replacing a burned-out central heat pump for all five Texas climate zones.

The rightsizing savings specified in the tables below are only applicable to replace-on-burnout projects. New construction projects are not eligible to receive deemed savings for system rightsizing.[172]

[172] For projects using a custom baseline see TRMv6.0 Volume 4.

Heating, Replace-on-Burnout—Replacement of an Electric Resistance Furnace

Table 2-160 through Table 2-164 present the energy savings (kWh) per heating load type associated with a central heat pump replacing on burnout an electric resistance furnace for all five Texas climate zones. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Heating, Early Retirement—Replacement of a Heat Pump

See Table 2-165 through Table 2-174 for the energy savings (kWh) per heating load type associated with a central heat pump replacing another heat pump for all five Texas climate zones. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Heating, Early Retirement—Replacement of an Electric Resistance Furnace

See Table 2-160 through Table 2-164 for the energy savings (kWh) per heating load type associated with a central heat pump replacing an electric resistance furnace for all five Texas climate zones.

Deemed Summer Demand Savings Tables[173]

Heat pumps 17 SEER or greater are assumed to be two-stage heat pumps, while those under 17 SEER are assumed to be single-stage heat pumps. This results in slightly lower summer demand savings for 17.0-17.9 SEER heat pumps as compared to 16.0-16.9 SEER units.

[173] Rated capacity ranges are specified with a 5% tolerance in accordance with AHRI Standard 210/240 to account for systems that are rated slightly below the applicable nominal capacity. AHRI Standard 210/240. Table J1. http://www.ahrinet.org/App_Content/ahri/files/STANDARDS/AHRI/AHRI_Standard_210-240_2017.pdf.

New Construction

Table 2-175 through Table 2-179 present the summer demand savings (kW) associated with a central heat pump being installed during new construction for all 5 Texas climate zones.

Replace-on-Burnout

Table 2-180 through Table 2-184 present the summer demand savings (kW) associated with a central heat pump replacing on burnout an HVAC system for all 5 Texas climate zones. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Early Retirement

Table 2-185 through Table 2-194 present the summer demand savings (kW) associated with a central heat pump replacing an HVAC system for all five Texas climate zones. These savings can be used with the replace-on-burnout energy savings in Table 2-180 through Table 2-184 to calculate summer demand savings. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Deemed Winter Demand Savings Tables[174]

New Construction or Replace-on-Burnout of a Heat Pump

Table 2-195 through Table 2-199 present the winter demand savings (kW) associated with a central heat pump being installed during new construction or replacing a burned-out central heat pump.

The rightsizing savings specified in the tables below are only applicable to replace-on-burnout projects. New construction projects are not eligible to receive deemed savings for system rightsizing.[175]

[174] Rated capacity ranges are specified with a 5 percent tolerance in accordance with AHRI Standard 210/240 to account for systems that are rated slightly below the applicable nominal capacity. AHRI Standard 210/240. Table J1. http://www.ahrinet.org/App_Content/ahri/files/STANDARDS/AHRI/AHRI_Standard_210-240_2017.pdf.

[175] For projects using a custom baseline see TRMv6.0 Volume 4.

Replace-on-Burnout—Replacement of Electric Resistance Furnace

Table 2-200 through Table 2-204 present the winter demand savings (kW) per heating load type associated with a central heat pump replacing an electric resistance furnace for all five climate zones. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Early Retirement—Replacement of a Heat Pump

See Table 2-205 through Table 2-214 for the winter demand savings (kW) associated with a central heat pump replacing another heat pump for all five Texas climate zones. In each table, the capacity of the efficient unit is represented in the columns and the capacity of the existing unit is represented in the rows. The savings are in the intersection of the appropriate efficient and existing capacities. Replacements where there has been no change in capacity are highlighted in light blue and bold text.

Early Retirement—Replacement of an Electric Resistance Furnace

See Table 2-200 through Table 2-204 for the winter demand savings (kW) associated with a central heat pump replacing an electric resistance furnace for all five Texas climate zones

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) of a central heat pump unit is 15 years based on the current DOE Final Rule standards for central heat pumps.[176]

This value is consistent with the EUL reported in the Department of Energy 76 Final Rule 37408 Technical Support Document for Energy Conservation Standards for Heat Pumps.[177]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Decision/action type (early retirement, replace-on-burnout, new construction)
- Cooling capacity of the installed unit (tons)
- Seasonal Energy Efficiency Ratio (SEER) and Energy Efficiency Ratio (EER) of the installed unit
- Heating Seasonal Performance Factor (HSPF) of the installed unit
- Type of unit replaced (e.g., electric resistance furnace, air source heat pump)
- Age of the replaced unit (Early Retirement only)
- Retired unit model number, serial number, manufacturer, and cooling capacity (Early Retirement or Rightsizing)
- Photograph of retired unit nameplate (Early Retirement or Rightsizing)
- If photograph of retired unit nameplate is unavailable or not legible, provide a photo and/or description documenting the reason why the nameplate photo was unobtainable (Early Retirement only)
- If photograph of retired unit nameplate is unavailable or not legible, provide estimated square footage of conditioned area served by the retired unit (Rightsizing only)

[176] Final Rule: Standards, Federal Register, 76 FR 37408 (June 27, 2011) and associated Technical Support Document. Accessed 10/21/2014. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/75. Download TSD at: http://www.regulations.gov/#!documentDetail;D=EERE-2011-BT-STD-0011-0012.

[177] Department of Energy, Federal Register, 76 FR 37408, Technical Support Document: 8.2.3.5 Lifetime. June 2011.

- Photograph demonstrating functionality of existing equipment and/or customer responses to survey questionnaire documenting the condition of the replaced unit and their motivation for measure replacement for early retirement eligibility determination (Early Retirement only)
- If replacing an evaporative cooler, application should include a statement that the customer decision to change equipment types predates or is independent of the decision to install efficient equipment

Document Revision History

Table 2-215: Residential Central Heat Pumps Revision History

TRM Version	Date	Description of Change
v1.0	11/25/2013	TRM v1.0 origin.
v2.0	4/18/2014	TRM v2.0 update. Low-income and Hard-to-Reach Market Transformation section merged with main measure as "Early Retirement" option. Updated by Frontier Associates, March 2014, based on new federal standards.
v2.1	1/30/2015	TRM v2.1 update. No revision.
v3.0	4/10/2015	TRM v3.0 update. Early retirement savings may be claimed through any appropriately designed program in accordance with EM&V team's memo, "Considerations for early replacement of residential equipment." Remaining useful lifetimes updated.
v3.1	11/05/2015	TRM v3.1 update. Revision of cooling savings to reflect heat-pump-specific performance curves. Extension of Early Retirement cooling savings tables to higher SEER values. Clarification around summer demand savings for single-stage and two-stage units.
v4.0	10/10/2016	TRM v4.0 update. Added RUL value for units with an age of one year. Added a default RUL value for when the age of the unit is unknown. Eliminated the eligibility requirement of the existing unit to have a minimum age of five years. Updated savings for 15.0-15.9 SEER range.
v5.0	10/2017	TRM v5.0 update. Switched to air conditioner capacity and EIR curve coefficients for estimated heat pump cooling savings. Updated energy savings to use TMY3 temperature bin hours. Updated demand savings for compliance with current peak definition. Added 12.44 SEER and 6.8 HSPF baseline savings tables previously referencing earlier version of TRM. Updated baseline to include replacing air conditioners with gas heat.
v6.0	11/2018	TRM v6.0 update. Updated baseline and eligibility requirements. Added rightsizing savings for replace on burnout in winter demand tables. Added language clarifying use of rated capacity vs nominal and updated the deemed savings tables to show rated Btuh. Clarified required documentation for early retirement.

2.2.6 Large Capacity Split System and Single-Package Air Conditioners and Heat Pumps Measure Overview

TRM Measure ID: R-HV-LC

Market Sector: Residential

Measure Category: HVAC

Applicable Building Types: Single-family, duplex and triplex, multifamily, manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout, new construction

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure applies to the installation of a split/packaged air conditioner (AC) or heat pump (HP) with a capacity exceeding that of a typical residential system (greater than or equal to 65,000 Btu/hr) in a retrofit or new construction application. This measure also applies to the installation of ground-source heat pumps (GSHP) with a capacity exceeding 65,000 Btu/hr.

Eligibility Criteria

The deemed savings apply to central AC/HPs with a capacity of 65,000-240,000 Btu/hr (5.4-20 tons) and GSHPs with a capacity of 65,000-135,000 Btu/hr (5.4-11.3 tons).

Equipment shall be properly sized to dwelling based on ASHRAE or ACCA Manual J standards.

Manufacturer data sheets on installed equipment or AHRI reference numbers must be provided.

Baseline Condition

New construction and replace-on-burnout baseline efficiency levels are provided in Table 2-123 and Table 2-217. These baseline efficiency levels reflect the latest minimum efficiency requirements from the current federal manufacturing standard, IECC 2015, and ASHRAE 90.1-2013.

Table 2-216: Large Capacity AC/HPs – Baseline Efficiency Levels for NC and ROB for AC/HP[179]

System Type	Capacity [Tons]	Heating Section Type	Baseline Efficiencies	Source[180]
Air conditioners	> 5.4 to < 11.3	None or Electric Resistance	11.2 EER 12.8 IEER	DOE Standards/ IECC 2015
		All Other	11.0 EER 12.6 IEER	
	≥ 11.3 to ≤ 20	None or Electric Resistance	11.0 EER 12.4 IEER	
		All Other	10.8 EER 12.2 IEER	
		All Other	9.8 EER 11.4 IEER	
		All Other	9.5 EER 11.0 IEER	
Heat Pump (cooling)[181]	5.4 to < 11.3	Heat Pump	11.0 EER 12.0 IEER	DOE Standards/ IECC 2015
	≥ 11.3 to ≤ 20		10.6 EER 11.6 IEER	
Heat Pump (heating)[182]	5.4 to < 11.3	Heat Pump	3.3 COP	DOE Standards/ IECC 2015
	≥ 11.3 to ≤ 20		3.2 COP	

179 IECC 2015 Table C403.2.3(1) and C403.2.3(2).

180 These baseline efficiency standards noted as "DOE Standards" are cited in the Code of Federal Regulations, 10 CFR 431.97. http://www.gpo.gov/fdsys/pkg/CFR-2012-title10-vol3/pdf/CFR-2012-title10-vol3-sec431-97.pdf.

181 ASHRAE 90.1-2010 Table 6.8.1B. These systems larger than 5.4 tons, the minimum efficiency levels provided in this table are based on systems with heating type "No Heating or Electric Resistance Heating", excluding systems with "All Other Types of Heating".

182 Heat pump retrofits must also exceed the baseline efficiency levels for heating efficiencies.

Table 2-217: Large Capacity AC/HPs – Baseline Efficiency Levels for NC and ROB for GSHPs[183]

System Type	Capacity (Btuh)	Cooling EWT Rating Condition	Minimum Cooling EER	Heating EWT Rating Condition	Minimum Heating COP
Water to air (water loop)	≥ 65,000 and < 135,000	86°F	13.0	68°F	4.3
Water to air (groundwater)		59°F	18.0	50°F	3.7
Brine to air (ground loop)		77°F	14.1	32°F	3.2
Water to water (water loop)		86°F	10.6	68°F	3.7
Water to water (groundwater)		59°F	16.3	50°F	3.1
Brine to water (ground loop)		77°F	12.1	32°F	2.5

High-Efficiency Condition

Package and split-systems must exceed the minimum efficiencies specified in Table 2-123 and Table 2-217.

For reference, both ENERGY STAR® and the Consortium for Energy Efficiency (CEE) offer suggested guidelines for high-efficiency equipment.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

$$Energy\ Savings\ [kWh_{savings}] = kWh_{Savings,C} + kWh_{Savings,H}$$

Equation 65

$$Energy\ (Cooling)\ [kWh_{Savings,C}] = Cap_C \times \left(\frac{1}{\eta_{baseline,C}} - \frac{1}{\eta_{installed,C}}\right) \times EFLH_C \times \frac{1\ kW}{1{,}000\ W}$$

Equation 66

$$Energy\ (Heating)\ [kWh_{Savings,H}] = Cap_H \times \left(\frac{1}{\eta_{baseline,H}} - \frac{1}{\eta_{installed,H}}\right) \times EFLH_H \times \frac{1\ kWh}{3{,}412\ Btu}$$

Equation 67

183 Values from ASHRAE 90.1-2013.

$$Peak\ Demand\ [kW_{Savings,C}] = Cap_C \times \left(\frac{1}{\eta_{baseline,C}} - \frac{1}{\eta_{installed,C}}\right) \times CF_C \times \frac{1\ kW}{1{,}000\ W}$$

Equation 68

$$Peak\ Demand\ [kW_{Savings,H}] = Cap_H \times \left(\frac{1}{\eta_{baseline,H}} - \frac{1}{\eta_{installed,H}}\right) \times CF_H \times \frac{1\ kW}{3{,}412\ Btuh}$$

Equation 69

Where:

$Cap_{C/H}$ = Rated equipment cooling/heating capacity of the installed equipment at AHRI standard conditions (Btu/hr); 1 ton = 12,000 Btu/hr

$\eta_{baseline,C}$ = Cooling efficiency of standard equipment (Btuh/W)

$\eta_{installed,C}$ = Rated cooling efficiency of the newly installed equipment (Btuh/W)

$\eta_{baseline,H}$ = Heating efficiency of standard equipment (Btuh/W or COP)

$\eta_{installed,H}$ = Rated heating efficiency of the newly installed equipment (Btuh/W or COP)

Note: Use EER for cooling kW and COP for heating kW and kWh savings calculations. SEER/IEER should be used to calculate cooling kWh for central ACs and HPs. EER should be used to calculate cooling kWh for GSHPs. Heating efficiencies expressed as HSPF will be approximated as a seasonal COP and should be converted using the following equation:

$$COP = \frac{HSPF}{3.412}$$

Equation 70

$CF_{C/H}$ = Seasonal peak coincidence factor (Table 2-218)

$EFLH_{C/H}$ = Cooling/heating equivalent full-load hours (Table 2-125)

Table 2-218: Large Capacity AC/HPs – Coincidence Factors by Climate Zone[184]

Season	Climate Zone 1: Amarillo	Climate Zone 2: Dallas	Climate Zone 3: Houston	Climate Zone 4: Corpus Christi	Climate Zone 5: El Paso
Summer	0.634	0.677	0.626	0.583	0.725
Winter	0.549	0.478	0.515	0.453	0.437

[184] See Volume 1, Appendix B.

Table 2-219: Large Capacity AC/HPs – Equivalent Full Load Cooling/Heating Hours[185]

Climate Zone	$EFLH_C$	$EFLH_H$
Climate Zone 1: Panhandle	1,142	1,880
Climate Zone 2: North	1,926	1,343
Climate Zone 3: South	2,209	1,127
Climate Zone 4: Valley	2,958	776
Climate Zone 5: West	1,524	1,559

Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Winter Demand Savings Tables

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on winter peak demand savings and methodology.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) is 18 years for a large capacity air conditioner and 15 years for a large capacity heat pump based on the current DOE Final Rule standards for central heat

[185] ENERGY STAR® Central AC/HP Savings Calculator. http://www.energystar.gov/certified-products/detail/heat_pumps_air_source.

pumps.[186] The EUL of a high-efficiency ground source heat pump unit is 20 years, consistent with the EUL reported in the DOE GSHP guide.[187]

These values are consistent with the EULs reported in the Department of Energy 76 Final Rule 37408 Technical Support Document for Energy Conservation Standards for Air conditioners and Heat Pumps.[188]

Program Tracking Data and Evaluation Requirements

It is required that the following list of primary inputs and contextual data be specified and tracked by the program database to inform the evaluation and apply the savings properly:

- Climate zone
- Decision/action type (new construction, retrofit)
- Cooling and heating capacity (Btu/hr)
- Full-load efficiency rating (EER) of the installed unit
- Part-load efficiency rating (SEER/IEER) of the installed unit (if applicable)
- Coefficient of Performance (COP) of the unit installed (heat pumps and GSHPs only)

2.2.7 Room Air Conditioners Measure Overview

TRM Measure ID: R-HV-RA

Market Sector: Residential

Measure Category: HVAC

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout, new construction, early retirement

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

The following deemed savings values are applicable in calculating an incentive for the installation of a high-efficiency room air conditioner in a newly-constructed home or a room air conditioner replaced with a higher efficiency room air conditioner in a dwelling occupied by a residential energy consumer.

Eligibility Criteria

Installed room air conditioners must be compliant with the current ENERGY STAR® specification for room air conditioners.

In order to be awarded early retirement savings, the unit to be replaced must be functioning at the time of removal with a maximum age of 12 years.

Baseline Condition

For new construction and replace-on-burnout, the baseline is assumed to be a new room air conditioning unit with a CEER rating that is compliant with the current federal standard,[190] effective June 1, 2014. The new standard is stated in terms of the Combined Energy Efficiency Ratio (CEER), which accounts for standby/off-mode energy usage. The new standard is stated in terms of the Combined Energy Efficiency Ratio (CEER), which accounts for standby/off-mode energy usage.

[190] DOE minimum efficiency standard for residential room air conditioners. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/41.

For early retirement, the baseline efficiency is assumed to match the minimum federal standard efficiencies in place prior to June 1, 2014.

Table 2-221: Room Air Conditioner Baseline Efficiencies for ER, ROB, and NC

Reverse Cycle (Yes/No)	Louvered Sides (Yes/No)	Capacity (Btu/hr)	Federal Standard prior to June 1, 2014	Federal Standard as of June 1, 2014

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Peak demand and annual energy savings for room air conditioners should be calculated as shown next.

New Construction or Replace-on-Burnout

Energy Savings Algorithms

$$kWh_{Savings,C} = CAP \times \frac{1\ kW}{1{,}000\ W} \times AOH_C \times \left(\frac{1}{CEER_{Base}} - \frac{1}{CEER_{RAC}}\right)$$

Equation 71

Where:

CAP	=	*Rated equipment cooling capacity of the installed room air conditioner (Btu/hr)*
AOH_C	=	*Annual operating hours for cooling (Table 2-223)*
$CEER_{Base}$	=	*Combined Energy Efficiency Ratio of the baseline cooling equipment (Table 2-221)*
$CEER_{RAC}$	=	*Combined Energy Efficiency Ratio of the installed room air conditioner*

Table 2-223: Room Air Conditioner Annual Operating Hours for Cooling[192]

Climate Zone	AOH_C
Climate Zone 1: Panhandle	820
Climate Zone 2: North	1,374
Climate Zone 3: South	1,308
Climate Zone 4: Valley	2,150
Climate Zone 5: West	1,204

Demand Savings Algorithms

$$kW_{Savings} = CAP \times \frac{1\ kW}{1{,}000\ W} \times \left(\frac{1}{CEER_{Base}} - \frac{1}{CEER_{RAC}}\right) \times CF$$

Equation 72

Where:

CAP	=	*Rated equipment cooling capacity of the installed room air conditioner (Btu/hr)*
$CEER_{Base}$	=	*Combined Energy Efficiency Ratio of the baseline cooling equipment (Table 2-221)*

[192] Association of Home Appliance Manufacturers (AHAM) Room Air Conditioner Cooling Calculator. http://www.cooloff.org/sub_cool.html.

$CEER_{RAC}$ = *Combined Energy Efficiency Ratio of the installed room air conditioner*

CF = *Coincidence Factor = (Table 2-4)*

Table 2-224: Room Air Conditioners—Coincidence Factors[193]

Season	Climate Zone 1: Amarillo	Climate Zone 2: Dallas	Climate Zone 3: Houston	Climate Zone 4: Corpus Christi	Climate Zone 5: El Paso
Summer	0.977	0.937	0.904	0.833	0.920

Early Retirement

Annual energy (kWh) and summer peak demand (kW) savings must be calculated separately for two time periods:

1. The estimated remaining life of the equipment that is being removed, designated the remaining useful life (RUL), and
2. The remaining time in the EUL period. (8—RUL)

Annual energy (kWh) savings are calculated by weighting the early retirement and replace-on-burnout savings by the RUL of the unit and the remainder of the EUL period, as outlined in the Volume 3 appendices.

Where:

RUL = *Remaining Useful Life (see Table 2-225); if unknown, assume the age of the replaced unit is equal to the EUL resulting in a default RUL of 5.0 years*

EUL = *Estimated Useful Life = 8 years*

[193] See Volume 1, Appendix B.

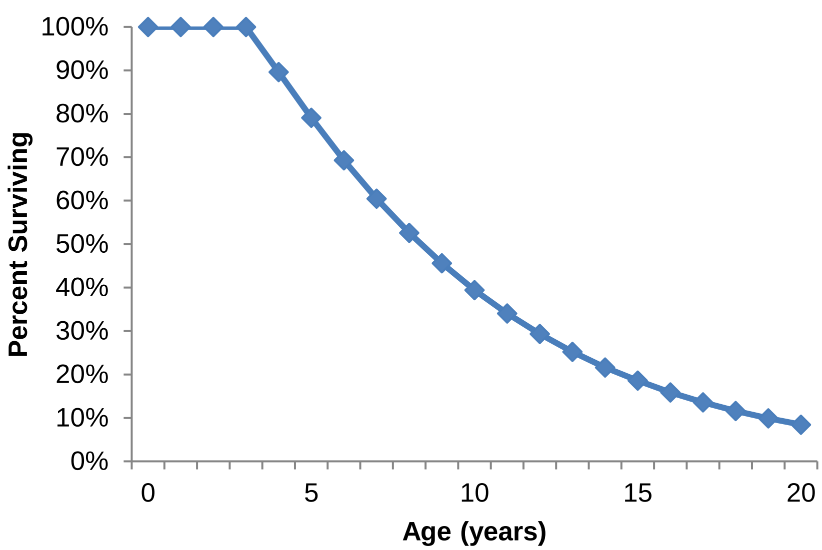
Table 2-225: Remaining Useful Life (RUL) of Replaced Room Air Conditioner

Age of Replaced Unit (years)	RUL (years)	Age of Replaced Unit (years)	RUL (years)
1	8.0	8	5.0
2	7.2	9	4.0
3	6.2	10	3.0
4	5.2	11	2.0
5	5.2	12	1.0
6	5.2	13[194,195]	0.0
7	5.2		

Derivation of RULs

Room air conditioners have an estimated useful life of 8 years. This estimate is consistent with the age at which approximately 50 percent of the room air conditioners installed in a given year will no longer be in service, as described by the survival function in Figure 2-5.

Figure 2-5: Survival Function for Room Air Conditioners[196]



194 RULs are capped at the 75th percentile of equipment age, 13 years, based on DOE survival curves. Systems older than 13 years should use the ROB baseline. See the January 2015 memo, “Considerations for early replacement of residential equipment,” for further detail.

195 Ward, B., Bodington, N., Farah, H., Reeves, S., and Lee, L. “Considerations for early replacement of residential equipment.” Prepared by the Evaluation, Measurement, and Verification (EM&V) team for the Electric Utility Marketing Managers of Texas (EUMMOT). January 2015. This document has been made available to all Texas investor-owned utilities through the EM&V team’s SharePoint.

196 Department of Energy, Federal Register, 76 FR 22454, Technical Support Document: 8.2.2.6 Product Lifetime. April 2011.

The method for estimating the remaining useful life (RUL). of a replaced system uses the age of the existing system to re-estimate the survival function.

Figure 2-5. The age of the room air conditioner being replaced is found on the horizontal axis, and the corresponding percentage of surviving room air conditioners is determined from the chart. The surviving percentage value is then divided in half, creating a new percentage. Then, the age (year) that corresponds to this new percentage is read from the chart. RUL is estimated as the difference between that age and the current age of the system being replaced.

Energy Savings Algorithms

For the RUL time period:

$$\boldsymbol{kWh_{savings,ER} = CAP \times \frac{1\ kW}{1{,}000\ W} \times AOH_C \times \left(\frac{1}{EER_{ER}} - \frac{1}{CEER_{RAC}}\right)}$$

Equation 73

For The remaining time in the EUL period., calculate annual savings as you would for a replace-on-burnout project:

$$\boldsymbol{kWh_{savings,ROB} = CAP \times \frac{1\ kW}{1{,}000\ W} \times AOH_C \times \left(\frac{1}{CEER_{ROB}} - \frac{1}{CEER_{RAC}}\right)}$$

Equation 74

Where:

CAP	=	*Rated equipment cooling capacity of the installed room air conditioner (Btu/hr)*
AOH_C	=	*Annual operating hours for cooling (Table 2-223)*
$CEER_{ROB}$	=	*Combined Energy Efficiency Ratio of the replace-on-burnout baseline cooling equipment (Table 2-221)*
EER_{ER}	=	*Energy Efficiency Ratio of the early retirement baseline cooling equipment (Table 2-221)*
$CEER_{RAC}$	=	*Combined Energy Efficiency Ratio of the installed room air conditioner*

Summer Demand Savings Algorithms

To calculate demand savings for the early retirement of a room air conditioner, a similar methodology is used as for replace-on-burnout installations, with separate savings calculated for the remaining useful life of the unit, and the remainder of the EUL as outlined in the section above.

---

http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/41. Download TSD at: http://www.regulations.gov/#!documentDetail;D=EERE-2007-BT-STD-0010-0053.

For the RUL time period:

$$kW_{Savings,ER} = CAP \times \frac{1\ kW}{1{,}000\ W} \times \left(\frac{1}{EER_{ER}} - \frac{1}{EER_{RAC}}\right) \times CF$$

Equation 75

For The remaining time in the EUL period., calculate annual savings as you would for a replace-on-burnout project:

$$kW_{Savings,ROB} = CAP \times \frac{1\ kW}{1{,}000\ W} \times \left(\frac{1}{EER_{ROB}} - \frac{1}{EER_{RAC}}\right) \times CF$$

Equation 76

Measure Life and Lifetime Savings

The estimated useful life (EUL) of a room air conditioning unit is 8 years based on the Technical Support Document for the current DOE Final Rule standards for room air conditioners.[197]

This value is consistent with the EUL reported in the Department of Energy 76 Final Rule 52852 Technical Support Document for Energy Conservation Standards for Room Air conditioners.[198]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Decision/action type (early retirement, replace-on-burnout, new construction)
- Cooling capacity of the installed unit (Btu/hr)
- Combined Energy Efficiency Ratio (CEER) of the unit installed
- Age of the replaced unit (early retirement only)

2.2.8 ENERGY STAR® Connected Thermostats Measure Overview

TRM Measure ID: R-HV-CT

Market Sector: Residential

Measure Category: HVAC

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit, new construction

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Engineering spreadsheets and estimates

Measure Description

Deemed savings are provided for the replacement of a standard or programmable thermostat with an ENERGY STAR® Connected Thermostat.

Eligibility Criteria

All residential customers with refrigerated air conditioning are eligible to claim cooling savings for this measure. Customers must have electrically-fueled central heating (either an electric resistance furnace or a heat pump) to claim heating savings.

The Connected Thermostats measure is primarily a residential retrofit measure, savings are presented for the average efficiency ratings of installed HVAC systems. Deemed savings are also presented for application to new construction for efficiency ratings of the units being installed (min. efficiency set by federal standards).

Baseline Condition

The baseline condition is a residential central HVAC system controlled by a thermostat that does not meet the criteria for a connected thermostat (see High Efficiency Condition). For connected thermostats installed in conjunction with an existing HVAC unit, the baseline condition is an HVAC unit controlled by a manual or programmable thermostat with an average efficiency for existing HVAC units in Texas estimated as shown in Table 2-2.

Table 2-227. Baseline Efficiency of Existing HVAC Systems

Application	Efficiency Rating	Efficiency
Air conditioner/heat pump cooling mode	SEER	12.2
Heat pump heating mode	HSPF	7.6
Electric resistance heat	COP	3.41

For connected thermostats installed in conjunction with a new HVAC unit (for both retrofit and new construction applications), the baseline condition is an HVAC unit controlled by a manual or programmable thermostat with the baseline HVAC unit efficiency being equal to the efficiency of the installed system. The efficiency ratings of newly-installed HVAC units should meet or exceed minimum values set by the federal manufacturing standards in effect at the time of the installation.

High-Efficiency Condition

The high efficiency condition is an HVAC unit being controlled by an ENERGY STAR® Connected Thermostat. Details about the Energy Star Connected Thermostats Specification are available on the program website[199], as is a list of program-certified thermostats.[200]

Energy and Demand Savings Methodology

Energy savings are estimated according to the program requirements established by the ENERGY STAR® program for thermostat service providers seeking certification. In addition to a series of other technical and programmatic requirements, providers must demonstrate that their thermostat services result in significant run-time reductions for the controlled cooling and heating equipment. Specifically, ENERGY STAR® provides the runtime reduction criteria reproduced in Table 2-228.

The ENERGY STAR runtime reductions are translated to energy savings estimates using the following information:

- Capacity and efficiency curves for HVAC performance under different temperature conditions
- Outdoor dry bulb temperature data (binned TMY3 data) for each TRM Climate Zone

Energy use under the range of temperature conditions is estimated for each bin in each climate zone. Base case total energy use for a system of given nominal capacity (and efficiency) is estimated by multiplying each bin's energy use estimate by the number of hours of estimated operation in that bin. Energy savings are estimated by applying the runtime reductions in Table 2-228 uniformly to each bin's energy use.

[199] Energy Star Certified Products: Connected Thermostats Specification V1.0. Online. Available: https://www.energystar.gov/products/spec/connected_thermostats_specification_v1_0_pd. Accessed: January 26, 2018.

[200] Energy Star Certified Products: Energy Star Certified Smart Thermostats. Online. Available: https://www.energystar.gov/productfinder/product/certified-connected-thermostats/results. Accessed: January 26, 2018.

Demand savings are not estimated for the Connected Thermostats measure.

Table 2-228. Connected Thermostat Runtime Reduction Criteria for Energy Star® Certification

Metric	Statistical Measure	Performance Requirement
Annual Percent Run Time Reduction, Heating (HS)	Lower 95% Confidence Limit of Weighted National Average	≥ 8%
	Weighted National Average of 20th Percentiles	≥ 4%
Annual Percent Run Time Reduction, Cooling (CS)	Lower 95% Confidence Limit of Weighted National Average	≥ 10%
	Weighted National Average of 20th Percentiles	≥ 5%
Average Resistance Heat Utilization for Heat Pump Installations (RU)	National Mean in 5°F Outdoor Temperature Bins from 0 to 60°F	Reporting requirement

Savings Algorithms and Input Variables

Deemed Energy Savings Tables

Savings are presented in kWh per ton of HVAC system capacity. For projects where tonnage is unknown, assume a default of 3.7 tons.[201]

Table 2-44 presents the annual energy savings for installations in which the connected thermostat is not installed in conjunction with the installation of a new HVAC unit.

Table 2-229: Energy Savings: Thermostats Installed with Existing HVAC Unit (kWh/ton)

Region	Cooling Savings	Heating Savings	
		ER Heat	Heat Pump
Climate Zone 1: Panhandle	121	485	199
Climate Zone 2: North	196	273	99
Climate Zone 3: South	229	178	62
Climate Zone 4: Valley	254	120	41
Climate Zone 5: West	167	283	98

When a connected thermostat is installed in conjunction with the installation of a new HVAC unit, the deemed savings are a function of the efficiency of the installed system. The deemed savings for connected thermostats installed on new HVAC units are provided in Table 2-230 and Table 2-43. The following savings are eligible to be claimed in both new construction programs and retrofit programs where a new HVAC system is installed.

[201] Based on review of average reported cooling capacity for central air conditioners and heat pumps installed in Texas utility programs in previous program years.

Table 2-230: Cooling Energy Savings: Thermostats Installed with New HVAC Unit (kWh/ton)

Region	SEER						
	14	14.5	15	16	17	18	21
Zone 1: Panhandle	108	103	99	92	81	77	66
Zone 2: North	174	167	161	150	131	124	107
Zone 3: South	204	196	189	175	154	146	126
Zone 4: Valley	226	217	209	194	169	160	138
Zone 5: West	149	143	138	128	112	106	91

Table 2-231: Heating Energy Savings (HP ONLY): Thermostats Installed with New HVAC Unit (kWh/ton)

Region	Heat Pump HSPF							
	8.2	8.5	8.6	8.7	9.0	9.3	9.5	9.7
Zone 1: Panhandle	188	181	177	177	170	163	159	156
Zone 2: North	93	89	87	87	82	78	77	75
Zone 3: South	57	55	53	53	51	48	47	46
Zone 4: Valley	38	37	36	36	34	32	31	31
Zone 5: West	91	87	85	85	80	76	75	73

The following table describes various equipment replacement scenarios that may be encountered and specifies which baseline should be used in each case. “Existing” corresponds to the savings from Table 2-44. “New” corresponds to the savings from Table 2-230 for cooling equipment and Table 2-43 for heating equipment.

Table 2-232: Baseline for Various Equipment Replacement Scenarios

Equipment Replacement Scenario	Baseline	
	Cooling	Heating
No HVAC equipment replacement	Existing	Existing
Non-condenser replacements (e.g. coil or furnace ONLY)	Existing	Existing
Air conditioner condenser replacement w/ gas furnace	New	No savings
Air conditioner condenser replacement w/ electric heat	New	Existing
Heat pump condenser replacement	New	New

For upstream programs, assume a heating type weighting of 41.8% gas, 49.3% electric resistance, and 9.0 percent heat pump heat.[202]

[202] Residential Energy Consumption Survey (RECS) 2015: Space heating in homes in the South and West Regions (HC6.8), February 27, 2017. https://www.eia.gov/consumption/residential/data/2015/.

Table 2-233: Upstream and Midstream Program Energy Savings[203] (kWh/thermostat)

Region	Total Energy Savings
Climate Zone 1: Panhandle	1,397
Climate Zone 2: North	1,256
Climate Zone 3: South	1,192
Climate Zone 4: Valley	1,172
Climate Zone 5: West	1,166

Deemed Summer Demand Savings Tables

Summer demand savings shall not be claimed for the connected thermostats measure.

Deemed Winter Demand Savings Tables

Winter demand savings shall not be claimed for the connected thermostats measure.

Example Deemed Savings Calculation

Example 1. A connected thermostat is installed on an existing 3.5-ton heat pump in Climate Zone 2.

$$Cooling\ Savings\ = 196\frac{kWh}{ton} \times 3.5tons = 686\ kWh$$

$$Heating\ Savings\ = 99\frac{kWh}{ton} \times 3.5tons = 347\ kWh$$

$$kWh\ savings = 686 + 347 = 1{,}033\ kWh$$

$$Summer\ kW\ savings = 0\ kW$$

$$Winter\ kW\ savings = 0\ kW$$

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) for a connected thermostat is 11 years.

This value is consistent with the EUL reported in the 2014 California Database for Energy Efficiency Resources (DEER).[204]

[203] Assuming smart thermostat is installed in conjunction with an existing 3.7 ton HVAC unit.
[204] 2014 California Database for Energy Efficiency Resources. http://www.deeresources.com/index.php/deer2013-update-for-2014-codes.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

All program types:

- Climate zone
- Number of smart thermostats sold/installed
- Smart thermostat manufacturer and model number

Additional requirements for all program types other than upstream/midstream:

- HVAC system type (AC/HP)
- Determine whether HVAC condenser was replaced in conjunction with thermostat
- HVAC capacity (tons)
- HVAC cooling efficiency (SEER) – ONLY if installed with new HVAC system
- HVAC heating efficiency (HSPF) – ONLY if installed with new heat pump
- Heating type (gas, electric resistance, heat pump, none)

Document Revision History

Table 2-234: Residential ENERGY STAR® Connected Thermostats Revision History

TRM Version	Date	Description of Change
v6.0	11/2018	TRM v6.0 origin.

2.2.9 Smart Thermostat Demand Response Measure Overview

TRM Measure ID: R-HV-TD

Market Sector: Residential

Measure Category: HVAC

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit, new construction

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Measurement and verification

Measure Description

Deemed demand savings are provided for calling demand response events on smart thermostats[205] in summer afternoons. A demand response event is the process through which a utility may optimize available resources by sending a signal to customers' smart thermostats. The signal modifies the smart thermostats temperature setting in order to reduce overall load demand from central refrigerated air conditioning.

Eligibility Criteria

All Texas residential customers with smart thermostats participating in climate zone 5 demand response events are eligible to claim demand savings for this measure.

Baseline Condition

The baseline condition is a Heating, Ventilation, and Air conditioning (HVAC) unit operating in absence of the demand response event and subsequent demand response activities.

High-Efficiency Condition

The high-efficiency condition is an HVAC unit being controlled by a smart thermostat and participating in a demand response event.

[205] In this case, smart thermostats are internet-enabled devices that control a home's heating and air conditioning and can be remotely controlled by El Paso Electric Company for demand response events.

Energy and Demand Savings Methodology

Demand savings were calculated using the "High 3 of 5 Baseline with Day-of Adjustment" method adopted in the Texas Technical Reference Manual Version 5.0 (TRM 5.0). This method considered the five most recent non-event non-holiday weekdays preceding an event and used data from the three days with the highest load within those five days to establish the baseline. "Day-of" adjustments were used to scale the baseline load estimate to the load conditions on the day of the event using data from the two hours prior to the time on the event day when participants were notified of the pending call for curtailment. In this specific program, customers were likely to experience a pre-cool period lasting up to one hour prior to the event. Therefore, the adjustment period was set as the two-hour period three hours prior to the event.

Interval metering devices were installed on a sample of households to record 15-minute interval kW demand of each house. Consumption data was recorded for a total of 50 homes in Texas. Data for customers in the sample was recorded beginning June 23, 2017. The deemed demand savings presented below were derived from this analysis.

Event-level savings are calculated by multiplying kW savings per household/device by the participating number of devices on that event, then adding all the groups savings together. The average of the events' savings represents the program year savings.

Energy savings are not estimated through this specific measure.

Savings Algorithms and Input Variables

The demand algorithms and associated input variables are listed below:

$$Verified\ Demand\ Savings = Baseline\ Period\ kW - Curtailment\ kW$$

Equation 77

Where:

$Baseline\ Period\ kW$ = *Baseline average demand calculated according to the High 3 of 5 Baseline Method*

$Curtailment\ kW$ = *Average demand measured during the curtailment period*

Deemed Energy Savings Tables

Energy savings shall not be claimed using the methodology described in this measure.

Deemed Summer Demand Savings Tables

Table 2-235. Deemed kW Savings Per Household/Device

Climate Zone	kW
5	0.90

Deemed Winter Demand Savings Tables

Winter demand savings shall not be claimed for the smart thermostats measure.

Example Deemed Savings Calculation

Example 1. A smart thermostat is installed in a home participating in summer demand response events:

$$Summer\ kW\ savings = 0.90\ kW$$

$$Winter\ kW\ savings = 0\ kW$$

$$kWh\ savings = 0\ \text{kWh}$$

Example 2. Suppose 10 events were called in an entire summer with participation counts listed in the table below. The total program year demand savings would be the average of the event-level savings.

Table 2-236. Example Total Program Year Demand Savings Calculation

Event #	Texas		Event-Level Demand Savings (kW)
	Participation #	Deemed Savings Per Household/Device (kW)	
Event 1	1000	0.90	900
Event 2	1100	0.90	990
Event 3	1200	0.90	1080
Event 4	1300	0.90	1170
Event 5	1400	0.90	1260
Event 6	1500	0.90	1350
Event 7	1400	0.90	1260
Event 8	1300	0.90	1170
Event 9	1200	0.90	1080
Event 10	1100	0.90	990
Total Program Year Demand Savings (kW):			1125

Measure Life and Lifetime Savings

The EUL for this measure is 1 year.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Number of smart thermostats participating in each event

References and Efficiency Standards

Petitions and Rulings

Not applicable.

Relevant Standards and Reference Sources

2.3 RESIDENTIAL: BUILDING ENVELOPE

2.3.1 Air Infiltration Measure Overview

TRM Measure ID: R-BE-AI

Market Sector: Residential

Measure Category: Building Envelope

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Building simulation modeling

Measure Description

This measure involves implementation of interventions to reduce the rate of air infiltration into residences. Pre- and post-treatment blower door air pressure readings are required to confirm air leakage reduction. The standard approach for estimating savings in this measure is based on the results obtained via pre- and post-leakage testing as defined in this measure.

Eligibility Criteria

Cooling savings in this measure apply to customers with central or mini-split electric refrigerated air conditioning in their homes. Homes must be centrally heated with either a furnace (gas or electric resistance) or a heat pump to claim heating savings. Customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs are eligible to claim heating savings for homes heated with gas or electric resistance space heaters. Customers participating in HTR or LI programs are also eligible to claim reduced cooling savings for homes cooled by one or more room air conditioners by applying an adjustment to deemed savings that is specified for homes with refrigerated air.

There is an upper limit of 5.2 CFM_{50} per square foot of house floor area for the pre-retrofit infiltration rate on eligible projects. For homes where the pre-retrofit leakage exceeds this limit, savings will be awarded against the leakage cap. At the utility's discretion, this cap may not apply to homes implementing the measure under low-income programs.[206] Utilities may require certification or competency testing of personnel who will perform the blower door tests.

Air leakage should be assessed through testing following Building Performance Institute (BPI) standards. In some limited cases, where testing is not possible or unsafe (e.g. due to potential presence of asbestos), visual assessment may be satisfactory. The air leakage testing should not be conducted in homes where either evidence of asbestos or mold is present or suspected due to the age of the home.[207]

Utilities' program manuals should be consulted for health and safety considerations related to implementation of air sealing measures.

Only structures with electric refrigerated air conditioning systems are eligible.

Baseline Condition

The baseline for this measure is the existing leakage rate of the treated residence. The existing leakage rate should be capped to account for the fact that the deemed savings values per CFM_{50} leakage reduction are only applicable up to a point where the existing HVAC equipment would run continuously. Beyond that point, energy use will no longer increase linearly with an increase in leakage.

Baseline assumptions used in the development of these deemed savings are based on a 2013 Lawrence Berkeley National Laboratory (LBNL) analysis of air leakage measurements of US houses.[208] The LBNL study showed that approximately 95 percent of the home infiltration rates were below a normalized leakage rate of 2.0. Normalized leakage can be converted to CFM_{50}/ft^2 using Equation 78 through Equation 80.

$$NL = 1{,}000 \times \frac{ELA_4}{A \times 0.3048^2} \times \left(\frac{H \times 0.3048}{2.5\ m}\right)^{0.3}$$

Equation 78

$$Q_{50} = {ELA_4} \Big/ \left(\sqrt{\frac{\rho}{2(4\ Pa)}} \times \left(\frac{4\ Pa}{50\ Pa}\right)^{0.65}\right)$$

Equation 79

---

206 Low-income customers are income-eligible customers served through a targeted low-income energy efficiency program as described in 25.181(r). This may also apply to income-eligible customers served through a hard-to-reach program that is also delivered following the guidelines in 25.181(r).

207 The Building Performance Institute, Inc. (BPI) Standard Reference: Building Performance Institute Technical Standards for the Building Analyst Professional, v2/28/05mda, Page 1 of 17, states: *"***Health and Safety***:* Where the presence of asbestos, lead, mold and/or other potentially hazardous material is known or suspected, **all relevant state and federal (EPA) guidelines must be followed to ensure technician and occupant safety**. Blower door depressurization tests may not be performed in homes *where there is a risk of asbestos becoming airborne and being drawn into the dwelling."*

208 Chan, W.R., Joh, J., and Sherman, M. H. Analysis of air leakage measurements of US houses. Environmental Energy Technologies Division, Lawrence Berkeley National Laboratory (LBNL), p. 616-625.

$$CFM_{50,pre}/ft^2 = \frac{Q_{50} \times 60 \times 35.3147}{A}$$

Equation 80

Where:

NL	=	*Normalized Leakage = 2.0 from LBNL study*
ELA_4	=	*Area of an orifice that would result in the same air-flow through the building envelope at a pressure difference of 4 Pa (m^2)*
A	=	*Average area of a home in Texas from RECS 2009 (ft^2) = 1,757 ft^2*
H	=	*Ceiling height (ft.) = 8.5 (default)* [209]
0.3048	=	*Constant to convert from feet to meters*
Q_{50}	=	*Leakage rate at 50 Pa (m^3/s)*
ρ	=	*1.2 kg/m^3 from LBNL study*
$CFM_{50,\ pre}/ft^2$	=	*Maximum per-square-foot pre-installation infiltration rate*
60	=	*Constant to convert from minutes to seconds*
35.3147	=	*Constant to convert from cubic meters to cubic feet*

Using the above approach, the maximum per-square-foot pre-installation infiltration rate is 5.2 CFM_{50}/ft^2. Therefore, to avoid incentivizing homes with envelope problems not easily remedied through typical weatherization procedures, or where blower door tests were improperly conducted, these savings should only be applied starting at a baseline CFM_{50}/ft^2 of 5.2 or lower.

High-Efficiency Condition

Blower door air pressure measurements must also be used to ensure that post-treatment air infiltration rates are not less than those set forth by the standard in Equation 81, based on floor area and number of bedrooms.[210] These calculated minimum CFM_{50} values assume two occupants for a one-bedroom dwelling unit and an additional person for each additional bedroom. At the utility's discretion, this minimum CFM_{50} requirement may be enforced as an eligibility requirement. Otherwise, savings may be claimed for projects where the measured final infiltration rate is less than the minimum allowable ventilation rate if the following conditions are met:

- Mechanical ventilation is present or introduced in compliance with ASHRAE 62.2-2013
- Post-treatment infiltration rate is reported as the actual measured CFM_{50} result

[209] Typical ceiling height of 8 feet adjusted to account for greater ceiling heights in some areas of a typical residence.

[210] ASHRAE 62.2-2013. CFM_{Nat} values converted to CFM_{50} values by multiplying by appropriate N factor.

- Savings are calculated using the TRM minimum allowable ventilation rate with no additional savings claimed for CFM reduction below this amount

Where higher occupant densities are known, the minimum rate shall be increased by 7.5 CFM_{Nat} for each additional person. A CFM_{Nat} value can be converted to CFM_{50} by multiplying by the appropriate N factor (Table 2-238).

$$Min\ CFM_{50} = [0.03 \times A_{Floor} + 7.5 \times OCC] \times N$$

Equation 81

Where:

Min CFM_{50}	=	*Minimum final ventilation rate (CFM_{50})*
A_{Floor}	=	*Floor area (ft^2)*
OCC	=	*BR + 1, where BR is the number of bedrooms; if number of home occupants is known to exceed BR + 1, occupancy should be used instead*
N	=	*N factor (Table 2-238)*

Table 2-238: N Factors[211]

Shielding	Number of Stories		
	1 Story	2 Story	3+ Stories
Well shielded	22.2	17.8	15.5
Normal	18.5	14.8	13.0
Exposed	16.7	13.3	11.7

The maximum CFM reduction percentage[212] is capped at 40 percent for RSOP homes. It is important to note that the minimum ventilation rate specified earlier in this section still applies for cases where the maximum 40 percent CFM reduction cannot be achieved due to the post CFM value being limited by the minimum allowable post CFM value provisioned for safety reasons.

The TRM stipulates an upper limit of 5.2 CFM_{50} per square foot of house floor area for the pre-retrofit infiltration rate as part of eligibility criteria. For homes where the pre-retrofit leakage exceeds this limit, energy and demand savings must be calculated using the pre-measure-installation leakage cap. Therefore, when the pre-retrofit leakage is capped, energy and demand savings can only be claimed for a 40 percent reduction in CFM compared to the capped pre-CFM value. When the pre-retrofit leakage is not capped, energy and demand savings can only be claimed for a 40 percent reduction in CFM compared to the tested, actual pre-retrofit infiltration rate of the home.

[211] Krigger, J. and Dorsi, C.,"Residential Energy: Cost Savings and Comfort for Existing Buildings". A-11 Building Tightness Limits, p. 284. Use Zone 2 for Texas climate. http://www.waptac.org/data/files/Website_docs/Technical_Tools/Building%20Tightness%20Limits.pdf.

[212] CFM reduction percentage is calculated as: (pre CFM value – post CFM value) / pre-CFM value

The TRM requires all contractors to provide sufficient evidence such as pictures capturing the scope/type of retrofit implemented and blower door test readings for all RSOP homes that reach a CFM reduction percentage within the range of 30–40 percent. In the absence of any evidence, the TRM places a cap of 30 percent CFM reduction for calculating energy and demand savings.

At the utility's discretion, the cap of 40 percent CFM reduction and the ceiling of 5.2 CFM_{50} for pre-retrofit infiltration rate may not apply to homes implementing the measure under low-income programs.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Calibrated simulation modeling was used to develop these deemed savings, which are expressed as linear functions of the leakage reduction achieved (in CFM_{50}).[213] Specifically, these deemed savings estimates were developed using BEopt 2.6, running EnergyPlus 8.4 as the underlying simulation engine. To model this measure, the prototype home models for each climate zone were modified as follows: the base case air infiltration rate was set to 20 ACH_{50}. Results from running the base case model provide estimated hourly energy use for the prototypical home prior to treatment. Post-treatment conditions were simulated by setting the leakage rate to 3 ACH_{50}.

Deemed savings are presented as a function of the CFM_{50} reduction achieved, as demonstrated by blower door testing. The kWh and kW per CFM_{50} values represented by the V_E, V_S, and V_W coefficients are derived by taking the difference between annual energy use and summer and winter peak demand as estimated by the two model runs, and normalizing to the CFM_{50} reduction achieved. The pre- and post-treatment ACH_{50} values (20 and 3, respectively) are converted to CFM_{50} by multiplying the pressurized air-change rate by the volume of the model home and dividing by 60 (minutes/hour).

Deemed Energy Savings Tables

Table 2-239 presents the energy savings per CFM_{50} reduction for a residential air sealing project. The following formula shall be used to calculate deemed energy savings for infiltration efficiency improvements.

$$Deemed\ Energy\ Savings = \Delta CFM_{50} \times \left(V_{E,C} \times CAF + V_{E,H}\right)$$

Equation 82

Where:

ΔCFM_{50} = *Air infiltration reduction in Cubic Feet per Minute at 50 Pascal*

$V_{E,C}$ = *Corresponding cooling savings value in Table 2-239*

[213] Model testing indicates a straight line relationship between demand and energy savings achieved and CFM50 reductions is appropriate with beginning and ending leakage rates within the ranges permitted by the measure.

CAF	=	*Cooling savings adjustment factor for homes with room air conditioners; set to 1.0 for homes with refrigerated air or set to 0.6 for homes with one or more room air conditioners*
$V_{E,H}$	=	*Corresponding heating savings value in Table 2-239*

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying $V_{E,C}$ in Table 2-239 by a factor of 0.6.

Table 2-239: Energy Savings V_E per CFM_{50} Reduction

Climate Zone	$V_{E,C}$: Cooling Savings	$V_{E,H}$: Heating Savings		
	Refrigerated Air	Gas Heat	Electric Resistance	Heat Pump
Zone 1: Panhandle	0.12	0.09	1.92	0.78
Zone 2: North	0.27	0.04	1.10	0.45
Zone 3: South	0.22	0.02	0.63	0.25
Zone 4: Valley	0.39	0.02	0.55	0.21
Zone 5: West*	0.07	0.03	0.88	0.34

Deemed Summer Demand Savings Tables

Table 2-240 presents the summer peak demand savings per CFM_{50} reduction for a residential air sealing project. The following formula shall be used to calculate deemed summer demand savings for air infiltration improvements.

$$\boldsymbol{Deemed\ Summer\ Demand\ Savings = \Delta CFM_{50} \times V_S \times CAF}$$

Equation 83

Where:

ΔCFM_{50}	=	*Air infiltration reduction in Cubic Feet per Minute at 50 Pascal*
V_S	=	*Corresponding value in Table 2-240*
CAF	=	*Cooling savings adjustment factor for homes with room air conditioners; set to 1.0 for homes with refrigerated air or set to 0.6 for homes with one or more room air conditioners*

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying $V_{E,C}$ in Table 2-240 by a factor of 0.6.

Table 2-240: Peak Summer Demand Savings V_S per CFM_{50} Reduction

Region	Summer kW Impact per CFM_{50} Reduction
Climate Zone 1: Panhandle	1.64E-04
Climate Zone 2: North	2.10E-04
Climate Zone 3: South	1.90E-04
Climate Zone 4: Valley	2.24E-04
Climate Zone 5: West	9.40E-05

Deemed Winter Demand Savings Tables

Table 2-241 presents the summer peak demand savings per CFM_{50} reduction for a residential air sealing project. The following formula shall be used to calculate deemed winter demand savings for air infiltration improvement:

$$\boldsymbol{Deemed\ Winter\ Demand\ Savings} = \boldsymbol{\Delta CFM_{50}} \times \boldsymbol{V_W}$$

Equation 84

Where:

ΔCFM_{50} = *Air infiltration reduction in Cubic Feet per Minute at 50 Pascal*

V_W = *Corresponding value in Table 2-241*

Table 2-241: Peak Winter Demand Savings V_W per CFM_{50} Reduction

Region	Winter kW Impact per CFM_{50} Reduction	
	Electric Resistance	Heat Pump
Climate Zone 1: Panhandle	9.42E-04	5.48E-04
Climate Zone 2: North	1.25E-03	6.93E-04
Climate Zone 3: South	8.61E-04	4.41E-04
Climate Zone 4: Valley	7.81E-04	3.60E-04
Climate Zone 5: West	2.92E-04	1.19E-04

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Example Deemed Savings Calculation

Example 1. A contractor uses a blower door test to estimate 12,000 CFM_{50} of pre-retrofit air leakage in a 2,200 square foot, 2-story, 3 bed-room home in Climate Zone 4 with a heat pump. The home is located in a well-shielded area. After identifying and sealing leaks, she performs another blower door test and measures 8,000 CFM_{50} of air leakage.

$$Max\ Initial\ Leakage\ Rate = 5.2 \times 2{,}200 = 11{,}440\ CFM_{50}$$

$$Reported\ Initial\ Leakage\ = Min(12{,}000, 11{,}400) = 11{,}440\ CFM_{50}$$

$$Capped\ Post\ Retrofit\ Leakage\ = 11{,}400\ \times\ (1 -\ 0.4) = 6{,}864\ CFM_{50}$$

$$Reported\ Post\ Retrofit\ Leakage\ = Max(8{,}000, 6{,}864) = 8{,}000\ CFM_{50}$$

$$Min.Post\ Retrofit\ Leakage\ (safety) = [0.03\ \times\ 2{,}200 + 7.5 \times 4]\ \times\ 14.8 = 1{,}421\ CFM_{50}$$

$$\Delta CFM_{50} = (11{,}440 - 8{,}000) = 3{,}440$$

$$kWh\ savings = (0.39 + 0.21)\ \times\ 3{,}440 = 2{,}064\ kWh$$

$$Summer\ kW\ savings = 2.24\ \times\ 10^{-4}\ \times\ 3{,}440 = 0.77\ kW$$

$$Winter\ kW\ savings = 3.60\ \times\ 10^{-4}\ \times\ 3{,}440 = 1.24\ kW$$

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

According to the DEER Final Report December 2008, the estimated useful life is 11 years for air infiltration reduction.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Pre-retrofit air infiltration in cubic feet per minute at 50 Pascal
- Post-retrofit air infiltration in cubic feet per minute at 50 Pascal
- Heating type (gas, resistance heat, heat pump)
- Square footage of the house
- Shielding level (well shielded, normal, exposed)
- Number of bedrooms
- Number of stories
- Number of occupants
- For RSOP homes that achieve a CFM reduction percentage of 30–40 percent: pictures capturing the scope/type of retrofit implemented and blower door test readings showing pre- and post-retrofit condition of the treated spot such as newly added door strip, caulking around window frame and recessed lighting fixtures

Document Revision History

Table 2-242: Residential Air Infiltration Revision History

TRM Version	Date	Description of Change
v1.0	11/25/2013	TRM v1.0 origin.
v2.0	4/18/2014	TRM v2.0 update. Minor edits to language. Added detail on methodology and model characteristics.
v2.1	1/30/2015	TRM v2.1 update. Addition of language referring contractors to program manuals for information regarding health and safety precautions.
v3.0	4/10/2015	TRM v3.0 update. Revision of minimum ventilation requirements, pre-retrofit cap on infiltration levels, Climate Zone 5 savings values for homes with heat pumps, and tracking number of bedrooms and occupants in a house.
v3.1	11/05/2015	TRM v3.1 update. Provided clarification around effects of occupancy on minimum final ventilation.
v4.0	10/10/2016	TRM v4.0 update. Updated energy and demand savings per new prototype energy simulation models. Introduced new protocols related to maximum CFM reduction percentage and its associated documentation requirements. Added a new example for calculating savings.
v5.0	10/2017	TRM v5.0 update. Added alternative approach to bypass the need to complete leakage testing in guidance memo to follow.
v6.0	11/2018	TRM v6.0 update. Removed alternative approach allowance at this time. Clarified the eligibility of projects where CFM_{post} falls below the minimum ventilation rate requirement.

2.3.2 Ceiling Insulation Measure Overview

TRM Measure ID: R-BE-CI

Market Sector: Residential

Measure Category: Building Envelope

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Building simulation modeling

Measure Description

Savings are estimated for insulation improvements to the ceiling area above a conditioned space in a residence.

Eligibility Criteria

Cooling savings in this measure apply to customers with central or mini-split electric refrigerated air conditioning in their homes, or to customers in TRM Climate Zones 1 and 5 who have evaporative cooling systems. Homes must be centrally heated with either a furnace (gas or electric resistance) or a heat pump to claim heating savings. Customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs are eligible to claim heating savings for homes heated with gas or electric resistance space heaters. Customers participating in HTR **or** LI programs are also eligible to claim reduced cooling savings for homes cooled by one or more **room** air conditioners by applying an adjustment to deemed savings that is specified for homes with refrigerated air.

Baseline Condition

Ceiling insulation levels encountered in existing homes can vary significantly, depending on factors such as the age of the home, type of insulation installed, and level of attic use (equipment, storage, etc.). Deemed savings have been developed based on different levels of encountered (existing) ceiling insulation in participating homes, ranging from no insulation material (R-0) to the equivalent of about 6 inches of fiberglass batt insulation (R-22). The current average ceiling insulation level at participating homes is to be determined and documented by the insulation installer. Degradation due to age and density of the existing insulation should be taken into account.

In the event that existing insulation is or has been removed during measure implementation, the existing R-value for claiming savings shall be based upon the R-value of the existing insulation prior to removal.

For any reported pre-retrofit R-value that falls below R-5, the TRM requires all contractors to provide sufficient evidence including two pictures: 1) a picture showing the entire attic floor, and 2) a close-up picture of a ruler that shows the measurement of the depth of the insulation. In the absence of evidence demonstrating pre-retrofit ceiling insulation below R-5, the lowest level of pre-retrofit ceiling insulation that can be claimed is the R-5 to R-8 range.

High-Efficiency Condition

A ceiling insulation level of R-30 is recommended throughout Texas as prescribed by the Department of Energy. Accordingly, deemed savings are provided for insulating to R-30. Adjustment factors are provided to allow contractors to estimate savings for installation of higher or lower levels of post-retrofit insulation: contractors should estimate post-retrofit R-value according to the average insulation depth achieved across the area treated and the R-per-inch of the insulation material installed.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Calibrated simulation modeling was used to develop these deemed savings values. Specifically, these deemed savings estimates were developed using BEopt 2.6, running EnergyPlus 8.4 as the underlying simulation engine. To model this measure, the prototype home models for each climate zone were modified as follows: the default R-value of ceiling insulation (R-15 in most zones) was set at different levels, ranging from R-0 (no ceiling insulation) to R-22. These modifications are shown in Table 2-243.

The model runs are used to estimate peak demand and energy use in the modeled home at each of the base case ceiling insulation levels. The change-case models were run with the ceiling insulated to R-30.

Table 2-243: Residential Ceiling Insulation—Prototypical Home Characteristics

Shell Characteristic	Value	Source
Base Ceiling Insulation	R-0 R1-R4 R5-R8 R9-R14 R15-R22	Existing insulation level
Change Ceiling Insulation	R-30	Efficiency measure—R-30 retrofit insulation level as required by DOE and Texas Department of Housing and Community Affairs programs in Texas

Deemed Energy Savings Tables

Table 2-244 through Table 2-248 present the energy savings (kWh) associated with ceiling insulation for the five Texas climate zones. Annual energy savings are the sum of cooling and heating savings for the appropriate equipment types.

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying the appropriate cooling value in Table 2-244 through Table 2-248 by a factor of 0.6.

Climate Zone 1: Panhandle Region

Table 2-244: Climate Zone 1: Panhandle Region—Deemed Annual Energy Savings for Residential Ceiling Insulation to R-30 (kWh/sq. ft)

Ceiling Insulation Base R-value	Cooling Savings		Heating Savings		
	Refrigerated Air	Evaporative Cooling	Gas Heat	Electric Resistance	Heat Pump
R-0	0.75	0.22	0.21	5.48	2.35
R-1 to R-4	0.62	0.18	0.18	4.60	1.97
R-5 to R-8	0.28	0.08	0.08	2.16	0.92

R-15 to R-22	0.10	0.03	0.01	0.33	0.13

Scale Down/Up Factors for Energy Savings: Insulation to Below or Above R-30

The factors presented in this section are to be used when the average post-retrofit insulation depth is providing more or less than R-30 insulation. Scale down factors are provided for the case when average post-retrofit insulation depth is not sufficient to achieve R-30; scale up factors are provided for the case when insulating to a level greater than R-30. In either case, the following equation should be applied to scale down or scale up the energy savings.

$$Energy\ Savings\ (kWh) = \{R30\ Savings/ft^2 + [S_{D/U} \times (R_{Achieved} - 30)]\} \times A$$

Equation 85

Where:

R30 Savings/ft² = *Sum of project-appropriate deemed Cooling and Heating Energy Savings per square feet taken from Table 2-249 through Table 2-248*

$S_{D/U}$ = *Project-appropriate scale-down or scale-up factor from either Table 2-249 or Table 2-250*

$R_{Achieved}$ = *Achieved R-value of installed insulation (e.g. for R-28,* $R_{Achieved}$ *= 28)*

A = *Treated area (ft²)*

If the ceiling is insulated to a level less than R-30, the following factors shall be applied to scale down the achieved energy savings per square foot of treated ceiling area.

Table 2-249: Energy Scale Down Factors: Ceiling Insulation to less than R-30 (kWh/sq. ft./ΔR)

Climate Zone	Cooling Savings		Heating Savings		
	Refrigerated Air	Evaporative Cooling	Gas Heat	Electric Resistance	Heat Pump
1	4.00E-03	1.16E-03	1.27E-03	3.26E-02	1.38E-02
2	6.66E-03	n/a	7.11E-04	2.00E-02	8.20E-03
3	6.22E-03	n/a	4.67E-04	1.38E-02	5.47E-03

Savings Tables

Table 2-251 through Table 2-255 present the summer demand savings (kW/sq. ft.) associated with ceiling insulation for the five Texas climate zones.

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying the appropriate cooling value in the refrigerated air column in Table 2-251 through Table 2-255 by a factor of 0.6.

Climate Zone 1: Panhandle Region

Table 2-251: Climate Zone 1: Panhandle Region—Residential Ceiling Insulation to R-30 Deemed Summer Demand Savings (kW/sq. ft.)

Ceiling Insulation Base R-value	Refrigerated Air	Evaporative Cooling
R-0	1.15E-03	3.44E-04
R-1 to R-4	9.78E-04	3.04E-04
R-5 to R-8	4.50E-04	1.47E-04
R-9 to R-14	2.33E-04	7.16E-05

Scale Down/Up Factors for Demand Reduction: Insulation to Below or Above R-30

The factors presented in this section are to be used when the average post-retrofit insulation depth is providing more or less than R-30 insulation. Scale down factors are provided for the case when average post-retrofit insulation depth is not sufficient to achieve R-30; scale up factors are provided for the case when insulating to a level greater than R-30. In either case, the following equation should be applied to scale down or scale up the summer peak demand savings.

$$Demand\ Savings\ (kW) = \left\{R30\ Savings/ft^2 + \left[S_{D/U} \times (R_{Achieved} - 30)\right]\right\} \times A$$

Equation 86

Where:

R30 Savings/ft² = *Sum of project-appropriate deemed Cooling and Heating Energy Savings per square feet taken from Table 2-251 through Table 2-255 or Table 2-258 through Table 2-262*

$S_{D/U}$	=	*Project-appropriate scale-down or scale-up factor from either Table 2-256 and Table 2-257 (Summer) or Table 2-263 and Table 2-264 (Winter)*
$R_{Achieved}$	=	*Achieved R-value of installed insulation (e.g. for R-28, $R_{Achieved}$ = 28)*
A	=	*Treated area (ft^2)*

If the ceiling is insulated to a level less than R-30, the following factors shall be applied to scale down the achieved winter peak demand savings per square foot of treated ceiling area.

Table 2-263: Winter Peak Demand Scale Down Factors: Ceiling Insulation to less than R-30 (kWh/sq. ft./ΔR)

Climate Zone	Gas Heat	Electric Resistance	Heat Pump
1	4.29E-07	1.21E-05	6.30E-06
2	3.97E-07	1.40E-05	9.55E-06
3	3.05E-07	1.10E-05	6.53E-06
4	3.19E-07	9.18E-06	4.32E-06
5	4.29E-07	1.21E-05	6.30E-06

If the ceiling is insulated to a level greater than R-30, the following factors shall be applied to scale up the achieved winter peak demand savings per square foot of treated ceiling area.

Table 2-264: Winter Peak Demand Scale Up Factors: Ceiling Insulation to greater than R-30 (kWh/sq. ft./ ΔR)

Climate Zone	Gas Heat	Electric Resistance	Heat Pump
1	2.76E-07	7.85E-06	4.19E-06
2	2.57E-07	8.33E-06	4.80E-06
3	2.19E-07	7.33E-06	4.46E-06
4	1.72E-07	5.79E-06	2.72E-06
5	2.76E-07	7.85E-06	4.19E-06

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Example Deemed Savings Calculation

Example 1 (Scale Up). A home in Climate Zone 5 with evaporative cooling and an electric resistance furnace insulates 400 square feet from a baseline of R-1 to an efficient condition of R-38.

$$Cooling\ kWh\ savings\ per\ sq.ft. = 0.32 + 7.63x10^{-4} \times (38 - 30) = \textit{0.33 kWh/sq. ft.}$$

$$Heating\ kWh\ savings\ per\ sq.ft. = 2.95 + 2.18x10^{-2} \times (38 - 30) = \textit{3.12 kWh/sq. ft.}$$

$$kWh\ savings = (0.33 + 3.12) \times 400 = \textit{1,381 kWh}$$

$$Summer\ kW\ savings\ per\ sq.ft. = 3.25 \times 10^{-4} + 1.89 \times 10^{-6} \times (38 - 30) = \textit{3.41} \times 10^{-4}\ \textit{kW/sq. ft.}$$

$$Summer\ kW\ savings = 3.41 \times 10^{-4} \times 400 = 0.14\ kW$$

$$Winter\ kWsavings\ per\ sq.ft\ = 8.13 \times 10^{-4} + 7.85 \times 10^{-5} \times (38 - 30) = \textit{8.76} \times 10^{-4}\ \textit{kW/sq. ft.}$$

$$Winter\ kW\ savings = 8.76 \times 10^{-4} \times 400 = 0.35\ kW$$

Example 2 (Scale Down). A home in Climate Zone 3 with an air-source heat pump insulates 550 square feet from a baseline of R-5 to an efficient condition of R-28.

$$Cooling\ kWh\ savings\ per\ sq.ft. = 0.46 + 5.47 \times 10^{-3} \times (28 - 30) = 0.45\ kWh/sq.ft.$$

$$Heating\ kWh\ savings\ per\ sq.ft. = 0.37 + 3.66 \times 10^{-3} \times (28 - 30) = 0.36\ kWh/sq.ft.$$

$$kWh\ savings = (0.45 + 0.36) \times 550 = 446.4\ kWh$$

$$Summer\ kW\ savings\ per\ sq.ft. = 5.51 \times 10^{-4} + 7.91 \times 10^{-6} \times (28 - 30) = 5.35 \times 10^{-4}\ kW/sq.ft.$$

$$Summer\ kW\ savings = 5.35 \times 10^{-4} \times 550 = 0.29\ kW$$

$$Winter\ kW\ savings\ per\ sq.ft. = 4.49 \times 10^{-4} + 6.53 \times 10^{-6} \times (28 - 30) = 4.36 \times 10^{-4}\ kW/sq.ft.$$

$$Winter\ kW\ savings = 4.36 \times 10^{-4} \times 550 = 0.24\ kW$$

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

According to the GDS Associates Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures (2007),[214] the Estimated Useful Life is 25 years for ceiling insulation.

Program Tracking Data and Evaluation Requirements

It is required that the following list of primary inputs and contextual data be specified and tracked by the program database to inform the evaluation and apply the savings properly:

- Climate zone
- Base R-value of original insulation
- R-value of installed insulation
- Space cooling system type (evaporative cooling, refrigerated air conditioning)
- Space heating system type (gas, electric, heat pump)
- Square footage of ceiling insulation installed above a conditioned space
- Only for homes with a reported baseline R-value that is less than R-5
- Two pictures: 1) a picture showing the entire attic floor, and 2) a close-up picture of a ruler that shows the measurement of the depth of the insulation

Document Revision History

Table 2-265: Residential Ceiling Insulation Revision History

TRM Version	Date	Description of Change
v1.0	11/25/2013	TRM v1.0 origin.
v2.0	4/18/2014	TRM v2.0 update. Added detail on methodology and model characteristics.
v2.1	1/30/2015	TRM v2.1 update. No revision.
v3.0	4/10/2015	TRM v3.0 update. Provided savings tables for installation of insulation up to R-38. Multiplier provided to adjust cooling side savings for homes with evaporative cooling due to lower energy usage and demand associated with evaporative coolers relative to refrigerated air conditioning. Climate Zone 2 savings values awarded for Climate Zone 5 homes with heat pumps.
v3.1	11/05/2015	TRM v3.1 update. Provided example savings calculations. Clarified that no heating demand savings are to be claimed for homes with a gas furnace.
v4.0	10/10/2016	TRM v4.0 update. Updated energy and demand savings per new prototype simulation models and introduced new protocols for baseline and post-retrofit R-values, their associated savings estimations and documentation requirements.
v5.0	10/2017	TRM v5.0 update. No revision.
v6.0	11/2018	TRM v6.0 update. No revision.

2.3.3 Attic Encapsulation Measure Overview

TRM Measure ID: R-BE-AE

Market Sector: Residential

Measure Category: Building Envelope

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Building simulation modeling

Measure Description

Savings are estimated for bringing the attic into conditioned space by insulating and sealing the attic walls and roofs, eliminating leakage (to outside), and removing ceiling insulation, if present, to enhance air flow between the attic and the conditioned space directly below. Savings are presented to facilitate two modes of participation: with or without blower door testing.

Eligibility Criteria

Cooling savings in this measure apply to customers with central or mini-split electric refrigerated air conditioning in their homes, or to customers in TRM Climate Zones 1 and 5 who have evaporative cooling systems. Homes must be centrally heated with either a furnace (gas or electric resistance) or a heat pump to claim heating savings. Customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs are eligible to claim heating savings for homes heated with gas or electric resistance space heaters. Customers participating in HTR **or** LI programs are also eligible to claim reduced cooling savings for homes cooled by one or more **room** air conditioners by applying an adjustment to deemed savings that is specified for homes with refrigerated air.

Baseline Condition

The baseline condition is a vented, unfinished attic with some level of ceiling insulation. Ceiling insulation levels in existing construction can vary significantly, depending on the age of the home, type of insulation installed, and activity in the attic (such as using the attic for storage and HVAC equipment). Deemed savings have been developed based on different levels of encountered (existing) ceiling insulation in participating homes, ranging from no insulation material (R-0) to the equivalent of about 6 inches of fiberglass batt insulation (R-22). The average ceiling insulation level prior to the retrofit for at participating homes is to be determined and documented by the contractor. Degradation due to age and density of the existing insulation should be taken into account.

In the event that existing ceiling insulation is or has been removed during measure implementation, the existing R-value will be based upon the R-value of the existing insulation prior to removal.

High-Efficiency Condition

Attic walls and roof deck are insulated to either R-19 or R-38. Vents are sealed, as are obvious leaks. Ceiling insulation between the attic and the conditioned space is removed.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Calibrated simulation modeling was used to develop these deemed savings values. Specifically, these deemed savings estimates were developed using BEopt 2.6, running EnergyPlus 8.4 as the underlying simulation engine. To model this measure, the prototype home models for each climate zone were modified as follows: the default R-value of ceiling insulation (R-15 in most zones) was set at different levels, ranging from R-0 (no ceiling insulation) to R-22 to establish baseline energy use prior to encapsulation of the attic. These modifications are shown in Table 2-266.

The model runs calculated energy use for the prototypical home prior to encapsulating the attic. Next, change-case models were run to calculate energy use with the floor insulation measure in place with either R-30 or R-38 insulation.

Table 2-266: Residential Attic Encapsulation—Prototypical Home Characteristics

Shell Characteristic	Value	Source
Base Attic Encapsulation	Vented Attic R-0 R1-R4 R5-R8 R9-R14 R15-R22	Typical construction practice throughout the state
Change Attic Encapsulation with blower door test	Sealed attic with no ceiling insulation and either R-19 or R-38 roof deck insulation	

Shell Characteristic	Value	Source
Change Attic Encapsulation without blower door test	Sealed attic with no ceiling insulation and either R-19 or R-38 roof deck insulation 18 percent leakage reduction	Leakage Reduction: mean reduction achieved via attic encapsulation according to ACCA Manual J, 8th Edition, Section 21-14[215]

Deemed Energy Savings Tables

This measure may be performed with pre- and post-retrofit blower door testing when implementing the attic encapsulation measure, particularly when also undertaking additional leakage reduction activities when implementing this measure. Alternatively, the measure may also be implemented without performing blower door testing.

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying the appropriate cooling value in Table 2-267 through Table 2-271 by a factor of 0.6.

With Blower Door Testing

When performing blower door testing, claim attic encapsulation measure savings according to Table 2-191 through Table 2-195, which present the energy savings (kWh) associated with performing the attic encapsulation measure for the five Texas climate zones without taking into account leakage reduction. Additionally, savings can be claimed for leakage reduction based on the results of blower door testing according to the Air Infiltration measure earlier in the Building Envelope section. Annual energy savings are the sum of cooling and heating savings for the appropriate equipment types. Savings are per square foot of conditioned space directly below the treated attic.

[215] Section 21-14 of ACCA Manual J states that, "…a foam encapsulated attic eliminates ceiling leakage to the outdoors (i.e. to a vented attic), which means that the reduction in infiltration Cfm may range from 3 to 30 percent, with an 18 percent mean, as noted above". See Air Conditioning Contractors of America. Manual J, 8th Edition Version 2.10. Nov. 2011, p. 188.

Without Blower Door Testing

Implementers choosing to perform the measure without performing blower door testing should claim attic encapsulation measure savings according to Table 2-272 through Table 2-276, which present the energy savings (kWh) associated with performing the attic encapsulation measure for the five Texas climate zones taking into account a mean leakage reduction of 18 percent. Annual energy savings are the sum of cooling and heating savings for the appropriate equipment types. Savings are per square foot of conditioned space directly below the treated attic.

Deemed Summer Demand Savings Tables

Summer demand savings are presented for those projects in which blower door testing is performed in conjunction with the measure and, subsequently, for those projects implemented without blower door testing.

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying the appropriate demand savings value in Table 2-282 through Table 2-286 by a factor of 0.6.

With Blower Door Testing

When performing blower door testing, claim attic encapsulation measure summer demand savings according to Table 2-282 through Table 2-286, which present the summer demand savings (kW) associated with attic encapsulation for the five Texas climate zones without taking into account leakage reduction. The savings in the tables are per square foot of conditioned space directly below the treated attic. Additionally, summer demand savings can be claimed for leakage reduction based on the results of blower door testing according to the Air Infiltration measure earlier in the Building Envelope section.

Examples

Example 1. A contractor seals the attic and adds R-38 insulation to the underside of the roof to a home with 900 square feet of conditioned space below the treated attic in Climate Zone 3 with refrigerated air and a gas furnace, which has existing ceiling insulation estimated at R-7.

$$kWh\ savings = (0.36 + 0.03) \times 900 = \mathit{356.4\ kWh}$$

$$Summer\ kW\ savings = 5.51 \times 10^{-4} \times 900 = 0.50\ kW$$

$$Winter\ kW\ savings = 4.93 \times 10^{-5} \times 900 = 0.04\ kW$$

Example 2. A contractor seals the attic and adds R-38 insulation to the underside of the roof to a home with 1,200 square feet of conditioned space below the treated attic in Climate Zone 4 with an air-source heat pump in which existing ceiling insulation is demonstrated to be only R-4.

$$kWh\ savings = (0.58 + 0.43) \times 1{,}200 = \mathit{1{,}207.2\ kWh}$$

$$Summer\ kW\ savings = 6.61 \times 10^{-4} \times 1{,}200 = 0.79\ kW$$

$$Winter\ kW\ savings = 5.63 \times 10^{-4} \times 1{,}200 = 0.68\ kW$$

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

According to the GDS Associates Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures (2007),[216] the Estimated Useful Life is 25 years for ceiling insulation. The measure life specified for ceiling insulation is also appropriate for attic encapsulation.

Program Tracking Data and Evaluation Requirements

It is required that the following list of primary inputs and contextual data be specified and tracked by the program database to inform the evaluation and apply the savings properly:

- Climate zone
- Base R-value of original insulation

[216] GDS Associates Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures (2007). http://library.cee1.org/sites/default/files/library/8842/CEE_Eval_MeasureLifeStudyLightsandHVACGDS_1Jun2007.pdf

- R-value of installed insulation
- Space cooling system type (evaporative cooling, refrigerated air conditioning)
- Space heating system type (gas, electric, heat pump)
- Square footage of conditioned space directly below the treated attic

Document Revision History

Table 2-297: Residential Attic Encapsulation Revision History

TRM Version	Date	Description of Change
v4.0	10/10/2016	TRM v4.0 origin.
v5.0	10/2017	TRM v5.0 update. Incorporated alternative savings path that includes savings for infiltration reduction.
v6.0	11/2018	TRM v6.0 update. Removed closed cell recommendation.

2.3.4 Wall Insulation Measure Overview

TRM Measure ID: R-BE-WI

Market Sector: Residential

Measure Category: Building Envelope

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Building simulation modeling

Measure Description

Wall insulation is added to the walls surrounding conditioned space in existing homes, either by removing wall enclosures and applying batt or spray insulation, or by otherwise filling (e.g. blowing loose insulation into) the cavity space between studs in the walls of existing homes. Walls may be either 2x4 or 2x6 construction. Savings are estimated for filling the wall cavities of 2x4 or 2x6 walls with fiberglass batts, cellulose, or closed-cell spray foam, and are presented per square foot of treated wall area (gross wall area less window and door area).

Eligibility Criteria

Cooling savings in this measure apply to customers with central or mini-split electric refrigerated air conditioning in their homes, or to customers in TRM Climate Zones 1 and 5 who have evaporative cooling systems. Homes must be centrally heated with either a furnace (gas or electric resistance) or a heat pump to claim heating savings. Customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs are eligible to claim heating savings for homes heated with gas or electric resistance space heaters. Customers participating in HTR **or** LI programs are also eligible to claim reduced cooling savings for homes cooled by one or more **room** air conditioners by applying an adjustment to deemed savings that is specified for homes with refrigerated air.

Refer to the Baseline Condition section below for eligibility criteria regarding pre-retrofit level of wall insulation.

Baseline Condition

The baseline is considered to be a house with little or no wall insulation in the wall cavity. For those homes for which a minimal level of insulation is encountered, baseline is established at R-4. This baseline should be used to represent homes for which installed insulation covers a very limited amount of the wall area to be treated, is significantly degraded, and/or is less than an inch thick. Homes with more than this base level of insulation are not eligible for the measure.

Baseline homes may have either 2x4 or 2x6 construction.

High-Efficiency Condition

The standard throughout Texas for adding wall insulation to an existing wall cavity is R-13, as prescribed by United States Department of Energy (DOE) and Texas Department of Housing and Community Affairs (TDHCA) programs. The standard is achieved by filling a 2x4 wall cavity with fiberglass batt or cellulose insulation, which typically provides an R-value per inch (thickness) of between 3 and 4 $hr \cdot ft^2 \cdot °F/BTU$. Other wall insulation materials may be used, such as closed-cell spray foam, which approximately provides an R-value of 6 per inch.

As such, deemed savings are provided for insulating 2x4 and 2x6 walls to the levels presented in Table 2-298:

Table 2-298: High-Efficiency Condition R-Values for 2x4 and 2x6 Walls

Insulation Material	2x4 Wall	2x6 Wall
Fiberglass batt or cellulose	R-13	R-17
Closed-cell spray foam	R-21	R-33

Wall insulation reduces the ventilation rate in the home and therefore a post-installation blower door test must be conducted. Results must comply with the Minimum Final Ventilation Rate discussed in the High-Efficiency Condition section found in the Air Infiltration section of this document. This requirement applies to retrofits implemented under the HTR and RSOP programs.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Calibrated simulation modeling was used to develop these deemed savings values. Specifically, these deemed savings estimates were developed using BEopt 2.6, running EnergyPlus 8.4 as the underlying simulation engine. To model this measure, the prototype home models for each climate zone were modified as follows: the default R-11 insulation was reduced to either R-0 or R-4.

The model runs calculated energy use for the prototypical home prior to the installation of the wall insulation measure. Next, change-case models were run to calculate energy use with the wall insulation measure in place.

Table 2-299: Residential Wall Insulation—Prototypical Home Characteristics, Climate Zones 1-4

Shell Characteristic	Value	Source
Base wall insulation	R-0 R-4	BEopt estimates wall assembly R-value for uninsulated walls to be 3.6 for 2x4 construction and 3.7 for 2x6 construction. Assembly R-values for R-4 walls are 6.7 and 7.1 for 2x4 and 2x6 construction, respectively. Listed base levels are for the insulation material only.
Change wall insulation 2x4 wall	R-13 R-21	For retrofit with fiberglass batt/cellulose and closed-cell spray foam, respectively.
Change wall insulation 2x6 wall	R-17 R-33	EF or retrofit with fiberglass batt/cellulose and closed-cell spray foam, respectively.

Deemed Energy Savings Tables

Savings are presented separately for insulating 2x4 wall construction and homes with 2x6 walls. Annual energy savings are the sum of cooling and heating savings for the appropriate equipment types.

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying the appropriate cooling value in Table 2-300 through Table 2-303 by a factor of 0.6.

2x4 Walls

Table 2-300 presents the deemed energy savings values for insulating 2x4 walls to R-13 for all five Texas climate zones.

Table 2-300: Deemed Annual Energy Savings, Insulation of 2x4 Walls to R- 13 (kWh/sq. ft.)

Climate Zone	Base Case Wall Insulation	Cooling Savings		Heating Savings

Climate Zone	Base Case Wall Insulation	Gas Heat	Electric Resistance	Heat Pump
Climate Zone 1: Panhandle	Uninsulated	7.66E-05	1.95E-03	1.00E-03
Climate Zone 2: North		7.77E-05	2.31E-03	1.56E-03
Climate Zone 3: South		8.62E-05	1.75E-03	1.02E-03
Climate Zone 4: Valley		5.11E-05	1.43E-03	6.73E-04
Climate Zone 5: West		1.96E-05	6.66E-04	2.82E-04
Climate Zone 1: Panhandle	R-4	3.35E-05	8.76E-04	4.53E-04
Climate Zone 2: North		3.60E-05	1.08E-03	7.44E-04
Climate Zone 3: South		3.72E-05	8.17E-04	4.92E-04
Climate Zone 4: Valley		2.43E-05	6.59E-04	3.06E-04
Climate Zone 5: West		6.87E-06	2.48E-04	1.06E-04

Examples

Example 1. A home with uninsulated 2x4 walls in Climate Zone 1 with evaporative cooling and an electric resistance furnace insulates 750 square feet to R-13 with fiberglass batt insulation.

$$kWh\ savings = (0.17 + 3.96) \times 750 = 3{,}091.5\ kWh$$

$$Summer\ kW\ savings = 2.40 \times 10^{-4} \times 750 = 0.18\ kW$$

$$Winter\ kW\ savings = 1.71 \times 10^{-3} \times 750 = 1.28\ kW$$

Example 2. A home in Climate Zone 4 with uninsulated 2x6 walls with a central air conditioning unit and a gas furnace insulates 500 square feet to R-17 with closed-cell spray foam.

$$kWh\ savings = (0.56 + 0.04) \times 500 = 300.0\ kWh$$

$$Summer\ kW\ savings = 4.56 \times 10^{-4} \times 500 = 0.23\ kW$$

$$Winter\ kW\ savings = 4.58 \times 10^{-5} \times 500 = 0.02\ kW$$

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

According to the GDS Associates Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures (2007), the Estimated Useful Life is 25 years for wall insulation.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Space heating system type (gas, electric, heat pump)
- Space cooling system type (evaporative cooling, refrigerated air conditioning)
- Square footage of retrofitted wall area (gross wall area excluding window and door area)

2.3.5 Floor Insulation Measure Overview

TRM Measure ID: R-BE-FI

Market Sector: Residential

Measure Category: Building Envelope

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Building simulation modeling

Measure Description

Floor insulation is installed on the underside of floor areas sitting below conditioned space. Typically, it is installed in ventilated crawlspaces. Savings are presented per square foot of treated floor area.

Eligibility Criteria

Cooling savings in this measure apply to customers with central or mini-split electric refrigerated air conditioning in their homes, or to customers in TRM Climate Zones 1 and 5 who have evaporative cooling systems. Homes must be centrally heated with either an electric resistance furnace or a heat pump to claim heating savings. Customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs are eligible to claim heating savings for homes heated with electric resistance space heaters. Customers participating in HTR **or** LI programs are also eligible to claim reduced cooling savings for homes cooled by one or more **room** air conditioners by applying an adjustment to deemed savings that is specified for homes with refrigerated air.

Homes with gas heating are disqualified for adding floor insulation since this may result in an energy penalty due to floors not getting cooled from the ground during summer.

Baseline Condition

The baseline is considered to be a house with pier and beam construction and no floor insulation against the floor of conditioned area.

High-Efficiency Condition

A floor insulation level of R-19 is recommended for site-built homes throughout Texas as prescribed by DOE and Texas Department of Housing and Community Affairs (TDHCA) programs. Batt insulation is recommended in most cases and must have the vapor barrier installed facing up and against the floor or conditioned area. Insulation should be attached or secured so that it can reasonably be expected to remain in place for at least 10 years.

Typical floor construction depth of manufactured homes usually does not allow R-19 batt to be installed within the floor joists so R-15 loose-fill insulation is recommended by TDHCA.

A minimum of 24-inch clearance from bottom of the insulation to the ground is required by Occupational Safety and Health Association (OSHA).

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Calibrated simulation modeling was used to develop these deemed savings values.

Savings values for the deemed savings estimates for this measure were developed using demand and energy savings calculated using BEopt 2.6, running Energy Plus 8.1 as the underlying simulation engine. To model this measure, the prototype home models for each climate zone were modified as follows: slab foundation was replaced with a crawlspace. A 5/8" thick wood floor is also specified.

The model runs calculated energy use for the prototypical home prior to the installation of the floor insulation measure. Next, change-case models were run to calculate energy use with the floor insulation measure in place.

Table 2-313: Residential Floor Insulation—Modifications to the Prototype Home Characteristics

Shell Characteristic	Value	Source
Foundation	Crawlspace	Skirting around perimeter is assumed uninsulated and vented. Ground under home is assumed to be bare, without any type of moisture barrier.
Base Floor Insulation	R-3.1	BEopt default for floor assembly, assuming 5/8" thick hardwood floor without carpet or other type of covering.
Change Floor Insulation	R-19 (except for manufactured housing, R-15)	Efficiency measure - retrofit insulation level as required by DOE and Texas Department of Housing and Community Affairs programs in Texas. Due to the typical floor joists depths found in manufactured housing, TDHCA recommends an R-15 loose-fill insulation for manufactured housing and other non-site-built homes.

Deemed Energy Savings Tables

Table 2-314 through Table 2-318 present energy savings on a kWh per square foot of insulation installed basis for all five Texas climate zones. Annual energy savings are the sum of cooling and heating savings for the appropriate equipment types.

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying the appropriate cooling value in Table 2-314 through Table 2-317 by a factor of 0.6.

Table 2-314: Climate Zone 1: Panhandle Region—Residential Floor Insulation Deemed Annual Energy Savings (kWh/sq. ft.)

Home Type	Cooling Savings		Heating Savings	
	Refrigerated Air	Evaporative Cooling	Electric Resistance	Heat Pump
Site-Built Home	-0.13	-0.07	1.72	0.68
Manufactured Home	-0.11	-0.06	1.52	0.60

Table 2-315: Climate Zone 2: North Region—Residential Floor Insulation Deemed Annual Energy Savings (kWh/sq. ft.)

Home Type	Cooling Savings		Heating Savings

Home Type	Electric Resistance	Heat Pump
Site-Built Home	3.54E-04	1.44E-04
Manufactured Home	3.19E-04	1.30E-04

Examples

Example 1. A manufactured home in Climate Zone 5 with evaporative cooling and an electric resistance furnace insulates 500 square feet.

$$kWh\ savings = (-0.06 + 0.97) \times 500 = \mathit{457.0\ kWh}$$

$$Summer\ kW\ savings = 1.85 \times 10^{-7} \times 500 = 0.00\ kW$$

$$Winter\ kW\ savings = 3.19 \times 10^{-4} \times 500 = 0.16\ kW$$

Example 2. A site-built home in Climate Zone 2 with an air-source heat pump insulates 825 square feet.

$$kWh\ savings = (-0.12 + 0.38) \times 825 = \mathit{212.0\ kWh}$$

$$Summer\ kW\ savings = 3.10 \times 10^{-5} \times 825 = 0.03\ kW$$

$$Winter\ kW\ savings = 2.88 \times 10^{-4} \times 825 = 0.24\ kW$$

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

According to the GDS Associates Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures (2007), the Estimated Useful Life is 25 years for floor insulation.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are: The climate zone

- Climate zone
- Space heating system type (gas, electric, heat pump)

- Space cooling system type (evaporative cooling or electric air conditioning)
- Home type (site built or manufactured)
- Square footage of installed insulation

2.3.6 ENERGY STAR® Windows Measure Overview

TRM Measure ID: R-BE-EW

Market Sector: Residential

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Measure Category: Building Envelope

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Building simulation modeling

Measure Description

ENERGY STAR® windows savings are calculated on per square foot of window basis, inclusive of frame and sash.

Eligibility Criteria

Cooling savings in this measure apply to customers with central or mini-split electric refrigerated air conditioning in their homes, or to customers in TRM Climate Zones 1 and 5 who have evaporative cooling systems. Homes must be centrally heated with either a furnace (gas or electric resistance) or a heat pump to claim heating savings. Customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs are eligible to claim heating savings for homes heated with gas or electric resistance space heaters. Customers participating in HTR **or** LI programs are also eligible to claim reduced cooling savings for homes cooled by one or more **room** air conditioners by applying an adjustment to deemed savings that is specified for homes with refrigerated air.

Baseline

Two base cases are contemplated: single-pane and double-pane windows. In both cases a metal frame is specified. Estimated U-Values and SHGCs for baseline windows are presented in Table 2-330.

Table 2-330: Baseline Windows

Number of Panes	U-Factor Btu/(h·ft^2·°F)	Solar Heat Gain Coefficient (SHGC)
1	1.16	0.76
2	0.76	0.67

High-Efficiency Condition

For a window to qualify for these deemed savings, it must meet the relevant ENERGY STAR® criteria for the location in the state where the window is to be installed. Table 2-331 lists the ENERGY STAR® specifications for windows as of January 1, 2015. These values are subject to updates in ENERGY STAR® specifications; energy efficiency service providers are expected to comply with the latest ENERGY STAR® code.

Table 2-331: ENERGY STAR® Windows Specifications effective January 2015

U.S. Region, ENERGY STAR®	U-Factor Btu/(h·ft^2·°F)	Solar Heat Gain Coefficient (SHGC)
North-Central	≤ 0.30	≤ 0.40
South-Central	≤ 0.30	≤ 0.25
Southern	≤ 0.40	≤ 0.25

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Deemed savings values have been estimated using calibrated simulation models. Base case homes were fitted with single-pane and double-pane windows: change case homes were equipped with windows meeting the appropriate ENERGY STAR window specification for the location in which the window was to be installed. The Climate Zones in the Energy Star Windows specification were mapped to the Texas TRM Climate Zones as shown in Table 2-332:

Table 2-332. TRM Climate Zones and ENERGY STAR® Windows Climate Zones

Texas TRM Climate Zones	U.S. Region, ENERGY STAR® Windows
Climate Zone 1: Panhandle	North-Central
Climate Zone 2: North	South-Central
Climate Zone 3: South	Southern
Climate Zone 4: Valley	Southern
Climate Zone 5: West	South-Central

Deemed Energy Savings Tables

Table 2-333 and Table 2-334 present the energy savings (kWh) for the five Texas climate zones. Annual energy savings are the sum of cooling and heating savings for the appropriate equipment types.

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying appropriate cooling values in Table 2-333 and Table 2-334 by a factor of 0.6.

Table 2-333: ENERGY STAR® Windows Replacing Single-Pane Windows, Deemed Annual Energy Savings (kWh/sq. ft.)

Climate Zone	Cooling Savings		Heating Savings		
	Refrigerated Air	Evaporative Cooling	Gas Heat	Electric Resistance	Heat Pump
Climate Zone 1: Panhandle	2.83	0.98	0.29	6.70	3.16
Climate Zone 2: North	5.42	-	0.10	3.09	1.45
Climate Zone 3: South	5.32	-	0.02	0.77	0.41

Climate Zone 2: North	3.89E-03	-
Climate Zone 3: South	3.51E-03	-
Climate Zone 4: Valley	2.99E-03	-
Climate Zone 5: West	3.86E-03	1.05E-03

Table 2-336: ENERGY STAR® Windows Replacing Double-Pane Windows, Deemed Summer Demand Savings (kW/sq. ft.)

Climate Zone	Refrigerated Air	Evaporative Cooling
Climate Zone 1: Panhandle	2.08E-03	8.36E-04
Climate Zone 2: North	2.80E-03	-
Climate Zone 3: South	2.40E-03	-
Climate Zone 4: Valley	2.15E-03	-
Climate Zone 5: West	2.76E-03	8.09E-04

Deemed Winter Demand Savings Tables

Table 2-337 and Table 2-338 presents the winter demand savings (kW) for the five Texas climate zones.

Table 2-337: ENERGY STAR® Windows Replacing Single-Pane Windows, Deemed Winter Demand Savings by Heat Type (kW/sq. ft.)

Climate Zone	Gas Heat	Electric Resistance	Heat Pump
Climate Zone 1: Panhandle	2.01E-04	4.98E-03	2.43E-03
Climate Zone 2: North	1.77E-04	4.73E-03	2.74E-03
Climate Zone 3: South	6.89E-05	1.78E-03	3.11E-04
Climate Zone 4: Valley	4.78E-05	1.65E-03	6.68E-04
Climate Zone 5: West	2.83E-05	1.10E-03	5.00E-04

Table 2-338: ENERGY STAR® Windows Replacing Double-Pane Windows, Deemed Winter Demand Savings by Heat Type (kW/sq. ft.)

Climate Zone	Gas Heat	Electric Resistance	Heat Pump
Climate Zone 1: Panhandle	1.32E-04	3.30E-03	1.64E-03
Climate Zone 2: North	1.12E-04	3.16E-03	1.89E-03
Climate Zone 3: South	2.33E-05	6.68E-04	3.58E-06
Climate Zone 4: Valley	1.53E-05	5.62E-04	2.34E-04
Climate Zone 5: West	1.31E-05	5.84E-04	2.76E-04

Examples

Example 1. A home in Climate Zone 1 with evaporative cooling and an electric resistance furnace replaces 125 square feet of single-pane windows with ENERGY STAR® windows.

$$kWh\ savings = (0.98 + 6.70) \times 125 = 960\ kWh$$

$$Summer\ kW\ savings = 1.16x10^{-3} \times 125 = 0.15\ kW$$

$$Winter\ kW\ savings = 4.98x10^{-3} \times 125 = 0.62\ kW$$

Example 2. A home in Climate Zone 5 with a central air conditioning unit and a gas furnace replaces 250 square feet of double-pane windows with ENERGY STAR® windows.

$$kWh\ savings = \left(4.24 + (-0.03)\right) \times 250 = 1{,}052.5\ kWh$$

$$Summer\ kW\ savings = 2.76 \times 10^{-3} \times 250 = 0.69\ kW$$

$$Winter\ kW\ savings = 1.31 \times 10^{-5} \times 250 = 0.00\ kW$$

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

According to the GDS Associates Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures (2007), the Estimated Useful Life is 25 years for ENERGY STAR® windows.

Program Tracking Data and Evaluation Requirements

It is required that the following list of primary inputs and contextual data be specified and tracked by the program database to inform the evaluation and apply the savings properly:

- Climate zone
- Space heating system type (non-electric, electric resistance, heat pump)
- Space cooling system type (evaporative cooling or electric air conditioning)
- Area of ENERGY STAR® windows installed

2.3.7 Solar Screens Measure Overview

TRM Measure ID: R-BE-SS

Market Sector: Residential

Measure Category: Building Envelope

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Building simulation modeling

Measure Description

Savings are presented for the installation of solar screens on west and/or south-facing windows or glass doors. Deemed savings are calculated per square foot of treated window or door opening.

Eligibility Criteria

Cooling savings in this measure apply to customers with central or mini-split electric refrigerated air conditioning in their homes, or to customers in TRM Climate Zones 1 and 5 who have evaporative cooling systems. The heating savings penalty applies to homes that are centrally heated with either a furnace (gas or electric resistance) or a heat pump.

Solar screens must be installed on windows or glass doors that face west or south and receive significant direct sun exposure. Solar screens must block at least 65 percent of the solar heat gain to qualify for deemed savings.

Baseline Condition

The baseline is a single pane, clear glass, unshaded, west-, or south-facing window with a solar heat gain coefficient of 0.68. Baseline window area is assumed to be 7.5 percent of the total wall area.

High-Efficiency Condition

Solar screen material installed on south or west-facing windows must reduce solar heat gain by at least 65 percent. Solar screens are not recommended for homes with electric resistance heat.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Deemed savings values have been estimated using calibrated simulation models. Specifically, these deemed savings estimates were developed using BEopt 2.6, running EnergyPlus 8.4 as the underlying simulation engine. A single modification was made to the prototype models for the various climate zone-HVAC type combinations to create the base case models for estimating savings for the solar screens measure. Windows facing all directions are assumed to be single-pane windows with U-Values of 1.16 BTU/h-ft^2-R and Solar Heat Gain Coefficients (SHGC) of 0.76.

For the change case models, an 80 percent reduction was applied to the solar heat gain coefficient for the south and west-facing windows.

Summer and winter peak demand savings are estimated by taking the difference in demand for the 20 hours identified from the TMY3 datasets in which the summer and winter peaks are most likely to occur as described in section 4 - Peak Demand Definitions, of TRM Volume 1.

The model assumes the average solar screen installed blocks 80 percent of the solar heat gain attributed to the south and west facing windows based on performance data from solar screens analyzed at sun angles of 30, 45 and 75 degrees to the window. [217]

While it is recommended that solar screens be removed during winter to allow the advantage of free heat from the sun, often they are not removed seasonally. This may be due to solar screens serving as an insect screen in addition to blocking the sun or simply that they're installed in difficult-to-reach areas such as second floor windows. The savings estimates presented herein assume that the installed solar screens remain in place year-round.

Thermal Performance Improvement

Manual J and other studies researched indicate a thermal improvement to a window with a solar screen due to reduced air infiltration. The National Certified Testing Laboratories provided a report stating a 15 percent reduction in the thermal transmittance of a single pane, ¼" clear glass window with a solar screen added to the exterior.

Another study that was conducted for NFRC indicated between a 22 percent and 4 percent improvement to the U-value of a window with a solar screen. A single pane, clear window has a 22 percent improvement with the addition of a solar screen, whereas a double pane, spectrally selective low-E window may only have a 4 percent improvement. The deemed savings models assume an average 10 percent improvement in thermal performance with the addition of a solar screen.

[217] Performance data from Matrix, Inc., Mesa, Arizona testing facility for Phifer Wire Products' SunTex screen, blocks 80 percent of solar heat gain.

Window Frame

The window frame accounts for 10-30 percent[218] of the window area and since it is opaque and blocks sunlight from entering the home, it is factored into the model. An average of 15 percent frame area was incorporated into the performance of the window.

Example Calculation

Example 1. A home in Climate Zone 4 with a central air conditioning unit and an electric resistance furnace installs 75 square feet of solar screens.

$$kWh\ savings = \left(6.09 + (-3.21)\right) \times 75 = 216\ kWh$$

$$Summer\ kW\ savings = 3.17 \times 10^{-3} \times 75 = 0.24\ kW$$

$$Winter\ kW\ savings = -2.32 \times 10^{-3} \times 75 = -0.17\ kW$$

Deemed Energy Savings Tables

Table 2-340 presents the deemed energy savings value per square foot of solar screen installed. Annual energy savings are the sum of cooling and heating savings for the appropriate equipment types.

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying appropriate cooling value in Table 2-340 by a factor of 0.6.

Table 2-340: Deemed Energy (kWh) Savings per Square Foot of Solar Screen

Climate Zone	Cooling Savings (kWh/sq. ft.)		Heating Savings (kWh/sq. ft.)		
	Refrigerated Air	Evaporative Cooling	Gas Heat	Electric Resistance	Heat Pump
Climate Zone 1: Panhandle	3.67	1.34	-0.62	-12.81	-4.54
Climate Zone 2: North	5.38	-	-0.29	-7.14	-2.56
Climate Zone 3: South	5.33	-	-0.16	-4.69	-1.69
Climate Zone 4: Valley	6.09	-	-0.09	-3.21	-1.16
Climate Zone 5: West	5.62	1.99	-0.44	-10.48	-3.81

[218] Residential Windows – A Guide to New Technologies and Energy Performance, 2000.

Deemed Summer Demand Savings Tables

Table 2-341 presents the deemed summer peak demand savings value per square foot of solar screen installed.

For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying appropriate cooling value in Table 2-341 by a factor of 0.6.

Table 2-341: Deemed Summer Peak Demand (kW) Savings per Square Foot of Solar Screen

Climate Zone	Refrigerated Air	Evaporative Cooling
Climate Zone 1: Panhandle	2.89E-03	1.35E-03
Climate Zone 2: North	3.42E-03	-
Climate Zone 3: South	3.29E-03	-
Climate Zone 4: Valley	3.17E-03	-
Climate Zone 5: West	3.12E-03	1.07E-03

Deemed Winter Demand Savings Tables

Table 2-342 presents the deemed winter peak demand savings value per square foot of solar screen installed. Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on winter peak demand savings and methodology.

Table 2-342: Deemed Winter Peak Demand (kW) Savings per Square Foot of Solar Screen

Climate Zone	Gas Heat	Electric Resistance	Heat Pump
Climate Zone 1: Panhandle	-1.16E-04	-1.73E-03	-9.45E-04
Climate Zone 2: North	-5.20E-05	-1.32E-03	-7.96E-04
Climate Zone 3: South	-1.07E-04	-2.65E-03	-1.71E-03
Climate Zone 4: Valley	-7.68E-05	-2.32E-03	-1.08E-03
Climate Zone 5: West	-1.45E-04	-3.34E-03	-1.30E-03

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) of solar screens is established at 10 years.

This value is consistent with the EUL reported in the 2014 California Database for Energy Efficiency Resources (DEER).[219]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Space cooling system type (evaporative cooling, refrigerated air conditioning)
- Space heating system type (gas, electric, heat pump)
- Square footage of windows or door openings treated

Document Revision History

Table 2-343: Residential Solar Screens Revision History

TRM Version	Date	Description of Change
v1.0	11/25/2013	TRM v1.0 origin.
v2.0	4/18/2014	TRM v2.0 update. Added detail on methodology and model characteristics. Savings awarded for south-facing windows, in addition to east- and west-facing windows.
v2.1	1/30/2015	TRM v2.1 update. No revision.
v3.0	4/10/2015	TRM v3.0 update. Multiplier provided to adjust cooling side savings for homes with evaporative cooling due to lower energy usage and demand associated with evaporative coolers relative to refrigerated air. Climate Zone 2 savings values awarded for Climate Zone 5 homes with heat pumps.
v3.1	11/05/2015	TRM v3.1 update. Provided example savings calculations.
v4.0	10/10/2016	TRM v4.0 update. Updated energy and demand savings per new prototype energy simulation models. Added separate savings for homes with evaporative cooling.
v5.0	10/2017	TRM v5.0 update. Added explicit reference to mini-split technology. Added provision for Low Income and Hard-to-Reach customers cooled by room air conditioners to claim savings.
v6.0	11/2018	TRM v6.0 update. No revision.

2.3.8 Cool Roofs Measure Overview

TRM Measure ID: R-BE-CR

Market Sector: Residential

Measure Category: Building Envelope

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Building simulation modeling

Measure Description

Reflective roofing materials reduce the overall heat load on a home by reducing the total heat energy absorbed into the building system from incident solar radiation. This reduction in total load provides space cooling energy savings during cooling season, but the same energy is free heat during heating season, so the measure saves energy in the summer but costs energy in winter. As such, cool roofs are most beneficial in warmer climates, and furthermore may not be recommendable for homes in which the primary heat source is electric resistance. The measure is for retrofit of existing homes.

Eligibility Criteria

Cooling savings in this measure apply to customers with central or mini-split electric refrigerated air conditioning in their homes, or to customers in TRM Climate Zones 1 and 5 who have evaporative cooling systems. Homes must be centrally heated with either a furnace (gas or electric resistance) or a heat pump to claim heating savings. Customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs are eligible to claim heating savings for homes heated with gas or electric resistance space heaters. Customers participating in HTR **or** LI programs are also eligible to claim reduced cooling savings for homes cooled by one or more **room** air conditioners by applying an adjustment to deemed savings that is specified for homes with refrigerated air.

Baseline Condition

The baseline condition is an existing home with a standard medium- or dark-colored roof.

High-Efficiency Condition

The measure requires installation of roof products that have been rated by the Cool Roof Rating Council and compliance with Energy Star certified roof product performance specifications for the relevant roof application. The Energy Star program classifies roofs with slope greater than 2/12 as having a steep slope and roofs with slope less than or equal to 2/12 as low slope roofs. Energy Star performance specifications for cool roof products for use on roofs with steep slopes and low slopes are provided in Table 2-344.

Table 2-344. Energy Star Solar Reflectance Specification for Cool Roof Products

Roof Slope	Characteristic	Performance Specification
Low Slope <= 2/12	Initial Solar Reflectance	>= 0.65
	3-Year Solar Reflectance	>= 0.50
High Slope > 2/12	Initial Solar Reflectance	>= 0.25
	3-Year Solar Reflectance	>= 0.15

In the event that a cool roof is installed concurrent with changes to attic insulation levels, savings should be claimed for the reflective roof according to the post-retrofit (ceiling or roof deck) insulation levels: savings for changes in insulation levels should be claimed separately according to the ceiling insulation or attic encapsulation measures, assuming the retrofit performed meets the requirements of those measures.

Energy and Demand Savings Methodology

Energy and demand savings are presented for cool roofs according to the rated 3-year reflectance of the installed cool roof product and the type of roof (low-slope, high-slope) on which it is installed.

Savings Algorithms and Input Variables

Calibrated simulation modeling was used to develop these deemed savings values. Specifically, these deemed savings estimates were developed using BEopt 2.6, running EnergyPlus 8.4 as the underlying simulation engine. To model this measure, the prototype home models for each climate zone were modified as follows. Roof slopes were modified to reflect representative levels for the low slope and steep slope roofs. A 1/12 slope was selected for modeling low slope roofs (defined as having slope <= 2/12), and a 4/12 slope was selected for modeling steep slope roofs (slope > 2/12). Based on the performance criteria and review of the rated 3-year reflectance of rated products listed in the CRRC database, four reflectance levels were selected for modeling: 0.2, 0.4, 0.6 and 0.8, representing 20 to 80 percent reflectance.

Because of the interplay between the performance of insulation and attic/roof deck temperatures, which are directly affected by the installation of a cool roof, savings were estimated for a range of different attic insulation scenarios: a range of ceiling insulation levels from no insulation (R-0) to R-30, and two roof deck insulation levels, R-19 and R-38, were modeled.

These modifications are shown in Table 2-266.

The model runs calculated energy use for the prototypical home prior to encapsulating the attic. Next, change-case models were run to calculate energy use with the floor insulation measure in place with either R-30 or R-38 insulation.

Table 2-345: **Residential Reflective Roof – Prototypical Home Characteristics**

Shell Characteristic	Value	Source
Base Case Roof Material	Medium Asphalt Shingle, Reflectance = 0.15	Prototype home default
Change Case Roof Material	Medium Asphalt Shingle, Reflectance = 0.2 Reflectance = 0.4 Reflectance = 0.6 Reflectance = 0.8	Lower reflectance levels only relevant for steep slope roofs. Modeled reflectance levels reflect midpoints of ranges: 0.15 <=R < 0.3 Reflectance 0.3 <=R < 0.5 Reflectance 0.5 <=R < 0.7 Reflectance > 0.7
Roof Slope: Low-Slope Roof	1/12	Not modified between base and change cases
Roof Slope: Steep Slope Roof	4/12	Not modified between base and change cases
Ceiling (attic floor) Insulation Levels	R-0 R1-R4 R5-R8 R9-R14 R15-R22 R-30	Not modified between base and change cases
Roof Deck (underside) Insulation Levels	R-19 R-38	Not modified between base and change cases

Deemed Energy Savings Tables

Savings are presented first for homes with ceiling insulation, and subsequently for those with roof deck insulation. For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying appropriate cooling values in Table 2-346 through Table 2-350 by a factor of 0.6.

Homes with Ceiling Insulation

Table 2-346 through Table 2-350 present the energy savings (kWh) for installation of a reflective roof on homes with varying levels of ceiling (attic floor) insulation for the five Texas climate zones. Annual energy savings are the sum of cooling and heating savings for the appropriate equipment types. Savings are per square foot of treated roof area.

Homes with Roof Deck Insulation

Table 2-351 through Table 2-355 present the energy savings (kWh) for installation of a reflective roof on homes with varying levels of ceiling (roof deck) insulation for the five Texas climate zones. Annual energy savings are the sum of cooling and heating savings for the appropriate equipment types. Savings are per square foot of treated roof area.

Climate Zone 1: Panhandle Region

Deemed Summer Demand Savings Tables

Savings are presented first for homes with ceiling insulation, and subsequently for those with roof deck insulation. For customers who participate in Hard-to-Reach (HTR) or Low Income (LI) programs, cooling savings may be claimed for homes cooled by one or more room air conditioners by multiplying appropriate cooling values in Table 2-356 through Table 2-360 by a factor of 0.6.

Homes with Ceiling Insulation

Table 2-356 through Table 2-360 present the summer demand savings (kW) associated with installation of a reflective roof in homes with varying levels of ceiling insulation (attic floor) for the five Texas climate zones. Savings are per square foot of treated roof area.

Examples

Example 1. A contractor installs 1500 square feet of white asphalt shingle roofing with a 3-year rated reflectance of 0.55 on a home in Climate Zone 3 with a roof slope of 4/12, refrigerated air and a gas furnace, which has existing ceiling insulation estimated at R-12.

$$kWh\ savings = (0.26 - \ 0.01) \times 1500 = 384\ \text{kWh}$$

$$Summer\ kW\ savings = 2.03x10^{-4} \times 1500 = 0.30\ \text{kW}$$

$$Winter\ kW\ savings = -6.46x10^{-6} \times 1500 = -0.01\ \text{kW}$$

Example 2. A contractor applies a reflective coating to a 1200 square foot home with a heat pump and a low-slope roof in Climate Zone 2, with R-19 roof deck insulation. The coating has a 3-year rated reflectance of 0.75.

$$kWh\ savings = (0.32 - \ 0.11) \times 1200 = 252\ \text{kWh}$$

$$Summer\ kW\ savings = 5.18x10^{-6} \times 1200 = 0.01\ \text{kW}$$

$$Winter\ kW\ savings = -5.31x10^{-5} \times 1200 = -0.06\ \text{kW}$$

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) for a cool roof measure is 15 years.

This value is consistent with the EUL reported in the 2014 California Database for Energy Efficiency Resources (DEER).[220]

Program Tracking Data & Evaluation Requirements

It is required that the following list of primary inputs and contextual data be specified and tracked by the program database to inform the evaluation and apply the savings properly:

- TRM Climate Zone
- R-value of insulation (as is, post measure installation of ceiling/roof insulation)
- Space cooling system type (evaporative cooling, refrigerated air conditioning)
- Space heating system type (gas, electric, heat pump)
- Square footage of reflective roofing material installed
- Slope of the roof (low or high slope)
- Three-year solar reflectance as rated by Cool Roof Rating Certification of the reflective material installed

TRM Version	Date	Description of Change
v6.0	11/2018	TRM v6.0 origin.

2.4 RESIDENTIAL: WATER HEATING

2.4.1 Faucet Aerators Measure Overview

TRM Measure ID: R-WH-FA

Market Sector: Residential

Measure Category: Water Heating

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure involves installing aerators on kitchen and bathroom water faucets as a retrofit measure.

Eligibility Criteria

The savings values are per faucet aerator installed. It is not a requirement that all faucets in a home be treated for the deemed savings to be applicable.

These deemed savings are for residential, retrofit-only installation of kitchen and bathroom faucet aerators. In order to be awarded these deemed savings, the fuel type of the water heater must be electricity.

Baseline Condition

The 2.2 gallon per minute (GPM) baseline faucet flow rate is based on the Energy Policy Act of 1992 (EPAct 92). The deemed savings assume that the existing faucet aerators have a minimum flow rate of 2.2 GPM. The US EPA WaterSense specification for faucet aerators is 1.5 GPM.[221]

Table 2-377: Faucet Aerators—Baseline and Efficiency Standard

Baseline	Efficiency Standard
2.2 GPM minimum	1.5 GPM maximum

[221] https://www.epa.gov/watersense/bathroom-faucets.

High-Efficiency Condition

Aerators that have been defaced so as to make the flow rating illegible are not eligible for replacement. For direct install programs, all aerators removed shall be collected by the contractor and held for possible inspection by the utility until all inspections for invoiced installations have been completed.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Energy Savings Algorithms

The deemed savings, for any faucet aerator change case using aerators with flow rates of 1.5 GPM or lower, are calculated as follows:

$$Energy\ Savings\ (per\ aerator) = \frac{\rho \times C_P \times (GPM_{Base} - GPM_{Low}) \times N \times t \times 365 \times \left(T_{FaucetAvg} - T_{SupplyAvg}\right)}{FPH \times RE \times Conversion\ Factor}$$

Equation 87

Where:

ρ	=	*Water density, 8.33 lbs/gallon*
C_P	=	*Specific heat of water, 1 Btu/lb°F*
GPM_{Base}	=	*Average baseline flow rate of aerator = 2.2 gallons per minute*
GPM_{Low}	=	*Post-installation flow rate of aerator, typically 1.5, 1.0, or 0.5 gallons per minute; if unknown, assume 1.5 gallons per minute*
N	=	*Average number of persons per household = 2.82 persons*[222]
t	=	*Average time in minutes of hot water usage per person per day; default = 2.34 min/person/day*[223]
$T_{SetPoint}$	=	*Average faucet temperature = 88°F*[224]

222 Occupants per home for Texas from US Census Bureau, "Persons per household, 2009-2013". Accessed December 2015. http://quickfacts.census.gov/qfd/states/48000.html.

223 Cadmus and Opinion Dynamics Evaluation Team, "Memorandum: Showerhead and Faucet Aerator Meter Study". Prepared for Michigan Evaluation Working Group. Derived by taking weighted average of average minutes per person per day specified for kitchens (4.5) and bathrooms (1.6) assuming 1 kitchen aerator and 2.93 bathrooms.

224 Cadmus and Opinion Dynamics Evaluation Team, "Memorandum: Showerhead and Faucet Aerator Meter Study". Prepared for Michigan Evaluation Working Group. Derived by taking weighted average of average temperature for kitchens (93 °F) and bathrooms (86 °F) assuming 1 kitchen aerator and 2.93 bathrooms.
Data collection discussed in Appendix D of the EM&V team's Annual Statewide Portfolio Report for Program Year 2014-Volume 1, Project Number 40891 (August 2015), also supports a default value of 120°F.

$T_{SupplyAverage}$	=	*Average supply water temperature (see Table 2-378)*
FPH	=	*Average number of faucets per household = 3.93 faucets*[225]
RE	=	*Recovery Efficiency (or in the case of heat pump water heaters, COP). If unknown, use 0.98 as a default for electric resistance water heaters or 2.2 for heat pump water heaters.*[226]
ConversionFactor	=	*3,412 Btu/kWh*

Demand Savings Algorithms

Demand savings will be calculated using the following formula:

$$Demand\ Savings\ (per\ aerator) = \frac{\rho \times C_P \times (GPM_{Base} - GPM_{Low}) \times N \times t \times 365 \times (T_{FaucetAvg} - T_{SupplySeasonal})}{FPH \times RE \times Conversion\ Factor} \times Ratio_{annual\ kWh}^{Peak_{seasonal}kW}$$

Equation 88

Where:

$T_{SupplySeasonal}$	=	*Seasonal supply water temperature (Table 2-378)*
$Ratio_{annual\ kWh}^{Peak_{seasonal}kW}$	=	*Ratio of peak seasonal kW to annual kWh savings (Table 2-379)*

Table 2-378: Water Mains Temperature

Climate Zone	Water Mains Temperature °F*		
	$T_{SupplyAverage}$	$T_{SupplySeasonal}$	
		Summer	Winter
Climate Zone 1: Panhandle	62.9	73.8	53.7
Climate Zone 2: North	71.8	84.0	60.6
Climate Zone 3: South	74.7	84.5	65.5
Climate Zone 4: Valley	77.2	86.1	68.5
Climate Zone 5: West	70.4	81.5	60.4

* Based on typical meteorological year (TMY) dataset for TMY3: http://rredc.nrel.gov/solar/old_data/nsrdb/1991-2005/tmy3/.

225 Faucets per home assumed to be equal to one (kitchen) plus number of half bathrooms and full bathrooms per home as specified in the 2009 Residential Energy Consumption Survey (RECS), Table HC2.10.

226 Default values based on median recovery efficiency of residential water heaters by fuel type in the AHRI database, at http://www.ahrinet.org.

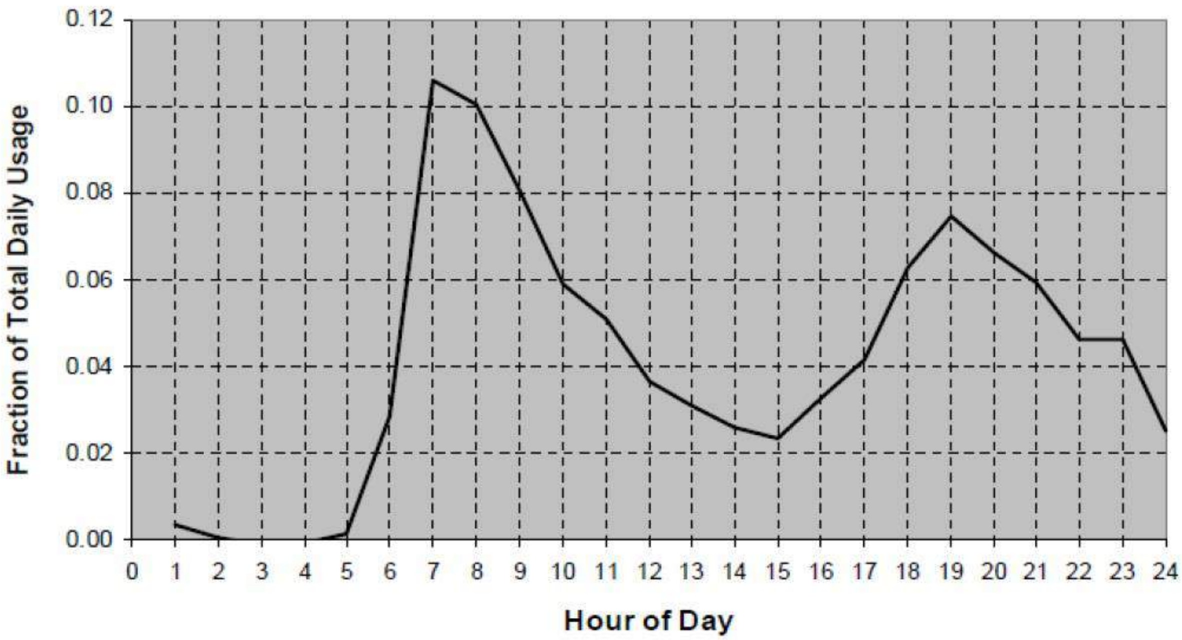
Table 2-379: Water Fixture Peak Demand Ratios

Peak Demand Ratios*	
Summer	**Winter**
0.000110	0.000274

* US Department of Energy's "Building America Performance Analysis Procedures for Existing Homes" combined domestic hot water use profile (http://www.nrel.gov/docs/fy06osti/38238.pdf).

The fixture peak demand ratios were derived by taking the fraction hot water use during the peak hour (summer: 4-5PM, winter: 7-8AM) to the total daily usage from the Building America Performance Analysis Procedures for Existing Homes, and dividing it by the number of days per year (365). The fraction of hot water use during the winter peak hour to total daily water usage is 0.1: $0.1/365 = 0.000274$. The summer peak hour to total daily water usage is 0.04: $0.04/365 = 0.000110$.

Figure 2-6: Shower, Bath, and Sink Hot Water Use Profile



Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) of a faucet aerator is established at ten years.

This value is consistent with the EUL reported in the 2014 California Database for Energy Efficiency Resources (DEER).[227]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Recovery Efficiency (RE) or COP, if available
- Flow rate in gallons per minute (GPM) of faucet installed
- Water heater type (e.g., heat pump, electric resistance)

References and Efficiency Standards

2.4.2 Low-Flow Showerheads Measure Overview

TRM Measure ID: R-WH-SH

Market Sector: Residential

Measure Category: Water Heating

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure consists of removing existing showerheads and installing low-flow showerheads in residences.

Eligibility Criteria

The incentive is for replacement of an existing showerhead with a new showerhead rated at 2.0, 1.7, or 1.5 gallons per minute (GPM). The only showerheads eligible for installation are those that are not easily modified to increase the flow rate.

These deemed savings are for showerheads installed as a retrofit measure in existing homes. In order to be awarded these deemed savings, the fuel type of the water heater must be electricity.

Baseline Condition

Federal standards set a maximum flow rate of 2.5 GPM,[228] while the US Environmental Protection Agency (EPA) WaterSense Program has implemented efficiency standards for showerheads requiring a maximum flow rate of 2.0 GPM.[229]

---

[228] http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/37.
[229] http://www.epa.gov/watersense/products/showerheads.html.

Table 2-381: Low-Flow Showerhead—Baseline and Efficiency Standards

Existing Showerhead Baseline Flow Rate	New Showerhead Flow Rate*
2.5 GPM maximum	1.5 GPM, 1.75 GPM or 2.0 GPM maximum

* All flow rate requirements listed here are the rated flow of the showerhead measured at 80 pounds per square inch of pressure (psi).

High-Efficiency Condition

In addition to the meeting the baseline requirements above, existing showerheads that have been defaced so as to make the flow rating illegible are not eligible for replacement. All showerheads removed shall be collected by the contractor and held for possible inspection by the utility until all inspections for invoiced installations have been completed.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Energy Savings Algorithms

Energy savings for this measure are calculated as follows:

$$Energy\ Savings\ (per\ showerhead) = \frac{\rho \times C_P \times (GPM_{Base} - GPM_{Low}) \times N \times t \times 365 \times (T_{ShowerAvg} - T_{SupplyAvg})}{SPH \times RE \times Conversion\ Factor}$$

Equation 89

Where:

ρ	=	*Water density, 8.33 lbs/gallon*
C_P	=	*Specific heat of water, 1 Btu/lb°F*
GPM_{Base}	=	*Average baseline flow rate of aerator = 2.5 gallons per minute*
GPM_{Low}	=	*Post-installation flow rate of aerator, typically 2.0, 1.75, or 1.5 gallons per minute; if unknown, assume 2.0 gallons per minute*
N	=	*Average number of persons per household = 2.82 persons*[230]
t	=	*Average time in minutes of hot water usage per person per day; default = 7.8 min/person/day*[231]

[230] Occupants per home for Texas from US Census Bureau, “Persons per household, 2009-2013”. Accessed December 2015. http://quickfacts.census.gov/qfd/states/48000.html.

[231] Cadmus and Opinion Dynamics Evaluation Team, “Memorandum: Showerhead and Faucet Aerator Meter Study”. Prepared for Michigan Evaluation Working Group.

$T_{SetPoint}$ = *Average shower temperature = 101°F* [232]

T_{Supply} = *Average supply water temperature (see Table 2-382)*

SPH = *Average number of showerheads per household = 1.68 showerheads*[233]

RE = *Recovery Efficiency (or in the case of heat pump water heaters, COP). If unknown, use 0.98 as a default for electric resistance water heaters or 2.2 for heat pump water* heaters.[234]

ConversionFactor = *3,412 Btu/kWh*

Demand Savings Algorithms

Demand savings will be calculated using the following formula:

$$Demand\ Savings\ (per\ showerhead) = \frac{\rho \times C_P \times (GPM_{Base} - GPM_{Low}) \times N \times t \times 365 \times (T_{ShowerAvg} - T_{SupplySeasonal})}{SPH \times RE \times Conversion\ Factor} \times Ratio_{annual\ kWh}^{Peak_{seasonal}kW}$$

Equation 90

Where:

$T_{SupplySeasonal}$ = *Seasonal supply water temperature (see Table 2-382)*

$Ratio_{annual\ kWh}^{Peak_{seasonal}kW}$ = *Ratio of peak seasonal kW to annual kWh savings (see Table 2-383)*

232 Data collection discussed in Appendix D of the EM&V team's Annual Statewide Portfolio Report for Program Year 2014-Volume 1, Project Number 40891 (August 2015), also supports a default value of 120°F.

233 Showerheads per home assumed to be equal to the number of full bathrooms per home as specified in the 2009 Residential Energy Consumption Survey (RECS), Table HC2.10.

234 Default values based on median recovery efficiency of residential water heaters by fuel type in the AHRI database, at http://cafs.ahrinet.org/gama_cafs/sdpsearch/search.jsp?table=CWH.

Table 2-382: Water Mains Temperature

Climate Zone	Water Mains Temperature (°F) *		
	$T_{SupplyAverage}$	$T_{SupplySeasonal}$	
		Summer	Winter
Climate Zone 1: Panhandle	62.9	73.8	53.7
Climate Zone 2: North	71.8	84.0	60.6
Climate Zone 3: South	74.7	84.5	65.5
Climate Zone 4: Valley	77.2	86.1	68.5
Climate Zone 5: West	70.4	81.5	60.4

* Based on typical meteorological year (TMY) dataset for TMY3: http://rredc.nrel.gov/solar/old_data/nsrdb/1991-2005/tmy3/.

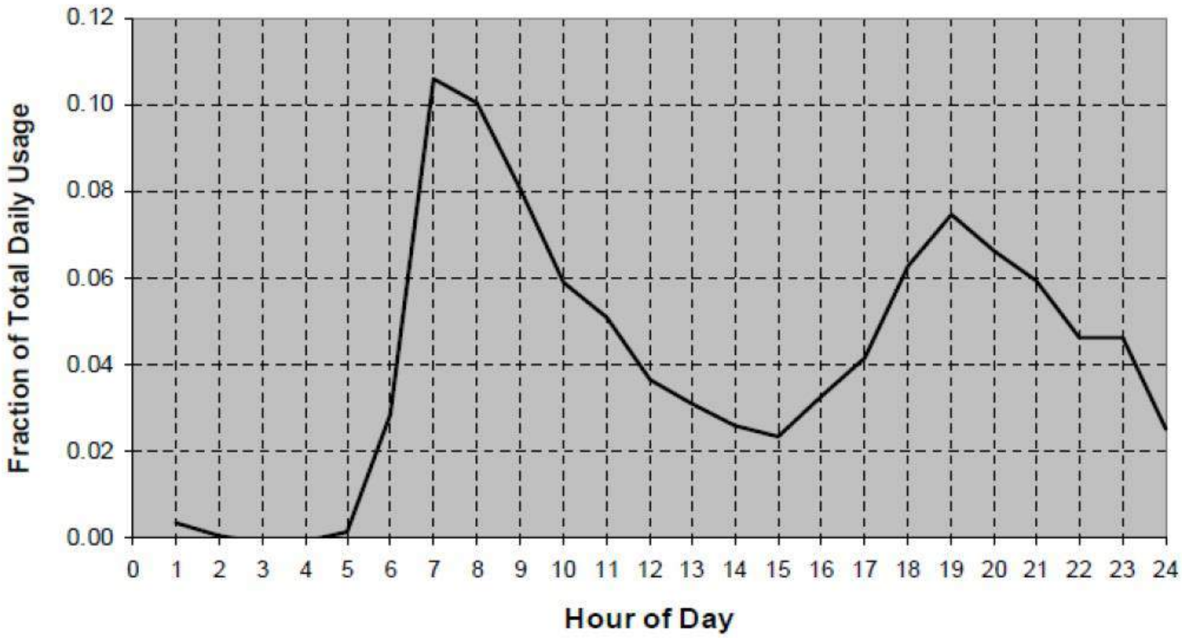
Table 2-383: Water Fixture Peak Demand Ratios

Peak Demand Ratios*	
Summer	Winter
0.000110	0.000274

* US Department of Energy's "Building America Performance Analysis Procedures for Existing Homes" combined domestic hot water use profile (http://www.nrel.gov/docs/fy06osti/38238.pdf).

The fixture peak demand ratios were derived by taking the fraction hot water use during the peak hour (summer: 4-5pm, winter: 7-8am) to the total daily usage from the Building America Performance Analysis Procedures for Existing Homes, and dividing it by the number of days per year (365). The fraction of hot water use during the winter peak hour to total daily water usage is 0.1: $0.1/365 = 0.000274$. The summer peak hour to total daily water usage is 0.04: $0.04/365 = 0.000110$.

Figure 2-7: Shower, Bath, and Sink Hot Water Use Profile



Source: Building America Performance Analysis Procedures for Existing Homes.

Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) of a low-flow showerhead is established at 10 years.

This value is consistent with the EUL reported in the 2014 California Database for Energy Efficiency Resources (DEER).[235]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Recovery Efficiency (RE) or COP, if available
- Flow rate in gallons per minute (GPM) of showerhead installed
- Water heater type (e.g., heat pump, electric resistance)

2.4.3 Water Heater Pipe Insulation Measure Overview

TRM Measure ID: R-WH-PI

Market Sector: Residential

Measure Category: Water Heating

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure requires the installation of pipe insulation on un-insulated water heater pipes that are served by an electric water heater.

Eligibility Criteria

Water heaters plumbed with heat traps are not eligible to receive incentives for this measure. It is recommended that the installer (or contractor) checks to see if the water heater heat trap works properly before declaring the water heater ineligible.

Water heater pipe insulation is a residential retrofit measure. New construction and retrofits involving the installation of new water heaters are not eligible for this measure, because they must meet current code requirements. In order to be awarded these deemed savings, the fuel type of the water heater must be electricity.

Baseline Condition

The baseline is assumed to be a typical electric water heater with no heat traps and no insulation on water heater pipes.

Table 2-385: Water Heater Pipe Insulation—Baseline Standard

Baseline
Un-insulated hot water pipes

High-Efficiency Condition

The efficiency standard requires an insulation thickness R-3. The International Residential Code (IRC) 2009 section N1103.3: Mechanical system piping insulation requires R-3 insulation.

Table 2-386: Water Heater Pipe Insulation—Efficiency Standard

Efficiency Standard
Minimum insulation of R-3

All visible hot water piping must be insulated. Savings are based on a maximum allowable insulation length of 6 feet of piping.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Energy Savings Algorithms

Hot water pipe insulation energy savings are calculated using the following formula:

$$Energy\ savings\ per\ year = \left(U_{pre} - U_{post}\right) \times A \times \left(T_{pipe} - T_{ambient\ annual}\right) \times \left(\frac{1}{RE}\right) \times \frac{Hours_{Total}}{conversion\ factor}$$

Equation 91

Where:

U_{pre}[236] = $\frac{1}{2.03} = 0.49\ ^{Btu}/_{hr \cdot sq.ft. \cdot {}^{\circ}F}$

U_{post} = $\frac{1}{2.03 + R_{Insulation}}$

$R_{Insulation}$ = *R-value of installed insulation*

A = *Pipe surface area insulated in square feet* (πDL) *with L (length) and D (pipe diameter) in feet. The maximum length allowable for insulation is 6 feet. If the pipe area is unknown, use the following table:*

[236] 2.03 is the R-value representing the film coefficients between water and the inside of the pipe, and between the surface and air. Mark's Standard Handbook for Mechanical Engineers, 8th edition.

Table 2-387: Estimated Pipe Surface Area

Pipe Diameter (inches)	Pipe Surface Area (square feet)[237]
0.5	0.16 x required input “Pipe Length insulated (feet)”
0.75	0.23 x required input “Pipe Length insulated (feet)”
1.0	0.29 x required input “Pipe Length insulated (feet)”

T_{pipe} *(°F)* = *120°F*[238]

$T_{ambientannual}$ *(°F)* = *Ambient annual temperature (see Table 2-388)*

RE = *Recovery Efficiency (or in the case of heat pump water heaters, COP). If unknown, use 0.98 as a default for electric resistance water heaters or 2.2 for heat pump water heaters.*[239]

$Hours_{Total}$ = *8,760 hr. per year*

Conversion factor = *3,412 Btu per kWh*

Demand Savings Algorithms

$$Pipe\ Insulation\ Demand\ Savings\ (kW) = (U_{pre} - U_{post}) \times A \times (T_{Pipe} - T_{ambient\ seasonal}) \times \left(\frac{1}{RE}\right) \times \frac{1}{conversion\ factor}$$

Equation 92

Where:

$T_{ambientseasonal}$*(°F)* = *Ambient seasonal temperature (see Table 2-388)*

237 Factors used in the calculation for pipe area were determined by using the outside diameter of the pipe in inches, converting it to feet, and multiplying by π as shown below.

Nominal Diameter (inches)	Outside Diameter (inches)	Factor to Calculate Pipe Area
0.5	0.625	0.16
0.75	0.875	0.23
1.0	1.125	0.29

238 120°F represents the assumed water heater setpoint. New York Department of Public Service recommends using water heater setpoint as a default value, see “New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs” October 2010, page 102.
Data collection discussed in Appendix D of the EM&V team’s Annual Statewide Portfolio Report for Program Year 2014-Volume 1, Project Number 40891 (August 2015), also supports a default value of 120°F.

239 Default values based on median recovery efficiency of residential water heaters by fuel type in the AHRI database, at http://www.ahrinet.org.

Table 2-388: Ambient Temperatures per Climate Zone

Climate Zone		Ambient Temperature (°F)					
		Water Heater Location: Unconditioned Space*			Water Heater Location: Conditioned Space**		
		Annual	Peak Seasonal		Annual	Peak Seasonal	
			Summer	Winter		Summer	Winter
1	Panhandle	65.5	106	32	72.7	75.1	69.3
2	North	73.1	108.1	42			
3	South	76.3	108.2	46			
4	Valley	78.4	103	55			
5	West	71.8	108	41.1			

* Average ambient temperatures were taken from TMY3 data, with a 7°F increase in winter and an 11°F increase in summer based on ASHRAE 152 Heating System and Cooling System Location Temperatures (Garage).

** Weighted average reported thermostat set points from RECS. Times associated with these set points are assumed to be the same as those assumed by ENERGY STAR®: http://www.energystar.gov/index.cfm?c=thermostats.pr_thermostats_guidelines.

Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) of water heater pipe insulation installed for an electric water heater is established at 13 years.

This value is consistent with the EUL reported in the 2014 California Database for Energy Efficiency Resources (DEER).[240]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- The R-value of the installed insulation
- Recovery Efficiency (RE) or COP, if available
- Pipe length insulated (feet)
- The pipe surface area insulated in square feet (at least the pipe diameter in inches)

2.4.4 Water Heater Tank Insulation Measure Overview

TRM Measure ID: R-WH-TI

Market Sector: Residential

Measure Category: Water Heating

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Retrofit

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure requires the installation of tank insulation on un-insulated water heater tanks that are served by an electric water heater.

Eligibility Criteria

Water heaters meeting the National Appliance Energy Conservation Act standards with respect to insulation and standby loss requirements are not eligible for this measure. To ensure compliance, the contractor shall inspect the build date listed on the existing water heater label and verify that the listed build date is before 1991.

Water heater pipe insulation is a residential retrofit measure. New construction and water heater replacements are not eligible for this measure, because they must meet current code requirements. In order to be awarded these deemed savings, the fuel type of the water heater must be electricity.

Baseline Condition

The baseline is assumed to be a typical electric water heater with no insulation.

High-Efficiency Condition

There is no minimum insulation requirement. Manufacturer's instructions on the water heater jacket and the water heater itself should be followed. Thermostat and heating element access panels must be left uncovered.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Energy Savings Algorithms

Hot water tank insulation energy savings are calculated using the following formula:

$$Energy\ savings\ per\ year = (U_{pre} - U_{post}) \times A \times (T_{tank} - T_{ambient\ annual}) \times \left(\frac{1}{RE}\right) \times \frac{Hours_{Total}}{conversion\ factor}$$

Equation 93

Where:

U_{pre}	=	*1/ (5) Btu/hr sq.ft. °F*
U_{post}	=	*1/ (5+$R_{Insulation}$)*
$R_{Insulation}$	=	*R-value of installed insulation*
A	=	*Tank surface area insulated in square feet* (πDL) *with L (length) and D (tank diameter) in feet. If the tank area is not known, use Table 2-390.*

Table 2-390: Estimated Tank Area

Volume (gal)	A (sf.) *
30	17.45
40	21.81
50	22.63
60	26.94
80	30.36
120	38.73

* Tank area was obtained from a survey of electric water heater manufacturer data. Dimensions for each tank size were collected and averaged to determine a typical square footage of each size water heater. Accessed April 2013: http://www.hotwater.com/water-heaters/residential/conventional/electric/promax/standard/. Accessed April 2013: http://www.whirlpoolwaterheaters.com/products/electric-water-heaters/es40r92-45d/.

T_{tank}(°F) = *Average temperature of the tank, default use 120°F* [241]

$T_{ambientannual}$ (°F) = *Ambient annual temperature (see Table 2-391)*

RE = *Recovery Efficiency (or in the case of heat pump water heaters, COP). If unknown, use 0.98 as a default for electric resistance water heaters or 2.2 for heat pump water heaters.* [242]

$Hours_{Total}$ = *8,760 hours per year*

Conversion factor = *3,412 Btu per kWh*

Demand Savings Algorithms

$$Tank\ Insulation\ Demand\ Savings\ (kW) = \left(U_{pre} - U_{post}\right) \times A \times (T_{Tank} - T_{ambient\ seasonal}) \times \frac{1}{RE} \times \frac{1}{conversion\ factor}$$

Equation 94

Where:

$T_{ambientseasonal}$(°F) = *Ambient seasonal temperature (see Table 2-391)*

Table 2-391: Ambient Temperatures per Climate Zone

Climate Zone		Ambient Temperature (°F)					
		Water Heater Location: Unconditioned Space			Water Heater Location: Conditioned Space		
		Annual	Peak Seasonal		Annual	Peak Seasonal	
			Summer	Winter		Summer	Winter
1	Panhandle	65.5	106	32	72.7	75.1	69.3
2	North	73.1	108.1	42			
3	South	76.3	108.2	46			
4	Valley	78.4	103	55			
5	West	71.8	108	41.1			

* Average ambient temperatures were taken from TMY3 data, with a 7°F increase in winter and an 11°F increase in summer based on ASHRAE 152 Heating System and Cooling System Location Temperature (Garage).

** Weighted average reported thermostat set points from RECS. Times associated with these set points assumed to be the same as those assumed by ENERGY STAR®: http://www.energystar.gov/index.cfm?c=thermostats.pr_thermostats_guidelines.

241 120°F represents the assumed water heater setpoint. New York Department of Public Service recommends using water heater setpoint as a default value, see "New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs" October 2010, page 99.
Data collection discussed in Appendix D of the EM&V team's Annual Statewide Portfolio Report for Program Year 2014-Volume 1, Project Number 40891 (August 2015), also supports a default value of 120°F.

242 Default values based on median recovery efficiency of residential water heaters by fuel type in the AHRI database, at http://www.ahrinet.org.

Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Winter Demand Savings Tables

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on winter peak demand savings and methodology.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) for storage water heater tank insulation is established at 7 years.

This value is consistent with the EUL reported in the 2014 California Database for Energy Efficiency Resources (DEER).[243]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Recovery Efficiency (RE) or COP, if available
- The R-value of the installed insulation
- Tank surface area insulated in square feet (πDL) with L (length) and D (tank diameter) in feet; if unable to determine tank area, tank volume must be recorded

2.4.5 Water Heater Installations—Electric Tankless and Fuel Substitution Measure Overview

TRM Measure ID: R-WH-WH

Market Sector: Residential

Measure Category: Water Heating

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Replace-on-Burnout, Early Retirement, New Construction

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure involves installing a new electric tankless or gas-fueled water heater (storage or tankless) in place of an electric storage water heater.[244]

Eligibility Criteria

This measure involves installing a gas storage, gas tankless (instantaneous), or electric tankless water heater in place of an electric storage water heater, and which meets all the additional requirements described below. HPWHs are not eligible for installation through this measure (see separate Heat Pump Water Heater measure). Currently, there are no conventional, electrically fueled storage units that sufficiently exceed the new federal standard to merit inclusion as an efficient condition in these deemed savings; therefore, deemed savings are only calculated for new gas storage, gas tankless, and electric tankless systems. Electric tankless water heaters may only replace systems with tanks less than 55 gallons. For the installation of an electric water heater with a tank size greater than 55 gallons, please refer to the Heat Pump Water Heater measure.

These deemed savings are for water heater replacements installed as a replace-on-burnout, new construction, or early retirement measure. However, savings are calculated under the assumption of replace-on-burnout or new construction. Savings may be awarded for installations in newly constructed homes where customer and utility representatives provide

[244] Previous versions of this measure included an incentive for installing high-efficiency conventional (electric resistance) storage water heaters. Increments to the federal standard for electric storage water heaters went into effect on April 16, 2015, eliminating the feasibility of continuing to provide deemed savings for these units.

written indication that an electric storage water heater would otherwise have been installed, along with relevant design documentation showing an electric storage water heater.

Baseline Condition

For most installations, the baseline condition is an electric storage water heater with baseline efficiency determined by tank size according to the amended federal energy efficiency standards for residential water heaters with tank sizes from 20 to 120 gallons, which took effect April 16, 2015, as published in 10 CFR Part 430.32 of the Federal Register (see Table 2-393).[245]

Table 2-393: Water Heater Replacement—Baseline

Rated Storage Volume	Energy Factor*
≥ 20 gal and ≤ 55 gal	0.960—(0.0003*V_s)
> 55 gal and ≤ 120 gal	2.057—(0.00113*V_s)

*V_s is the volume of the water heater storage tank.

The new DOE efficiency standard effectively requires HPWHs (assuming electric water heating) for electric storage water heaters with tank size greater than 55 gallons. As such, electric water heaters with tanks greater than 55 gallons are not eligible for this measure. Instead, see the Heat Pump Water Heater measure. Furthermore, gas water heaters greater than 55 gallons must use HPWH baseline consumption to calculate savings, as shown in the deemed savings provided at the end of this measure.

For smaller systems, the baseline technology remains an electric storage water heater with electric resistance as the primary heat source. This baseline assumes a replace-on-burnout scenario.

High-Efficiency Condition

For water heater replacement and fuel substitution, the new unit must meet the following federal minimum energy factor shown in Table 2-394. Water heaters must be installed in accordance with local code requirements.

Table 2-395 shows storage water heater energy factors for common tank volumes.

[245] *10 CFR Part 430.32 Energy and water conservation standards and their effective dates*. Accessed February 2014. Available online: http://www.gpo.gov/fdsys/pkg/CFR-2012-title10-vol3/pdf/CFR-2012-title10-vol3-sec430-32.pdf.

Table 2-394: Water Heater Replacement—Efficiency Standards

Energy Source	Tank Volume (unit being replaced)	Standard Energy Factor
Electric tankless	≥ 20 gal and ≤ 55 gal	0.98*
	> 55 gal	N/A
Gas tankless	≥ 20 gal	0.82—0.0019 × V_s
Gas storage	≥ 20 gal and ≤ 55 gal	0.675—0.0015 × V_s
	> 55 gal	0.8012—0.00078 × V_s

* The lowest energy factor associated with an electric tankless water heater in the AHRI database was 0.98 as of March 2014. http://www.ahridirectory.org/ahridirectory/pages/home.aspx.

** V_s is the rated storage volume of the new water heater.

Table 2-395: Storage Water Heater Energy Factors for Common Tank Volumes (not exhaustive)

Fuel Type	Tank Volume (Gallons)			
	30	40	50	80
Baseline—electric storage	0.951	0.948	0.945	1.967*
Efficiency standard—gas storage	0.630	0.615	0.600	0.739

* Baseline value from the Heat Pump Water Heater measure.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

All deemed savings values are calculated using the following standard algorithms for water heating. These algorithms assume a replace-on-burnout or new construction scenario, but may be used to award savings for early retirement projects.

Electric Tankless Water Heater

Energy Savings Algorithm

$$kWh_{savings} = \frac{\rho \times C_p \times GPY \times (T_{setpoint} - T_{supply,annual}) \times \left(\frac{1}{EF_{pre}} - \frac{1}{EF_{post}}\right)}{3{,}412}$$

Equation 95

Where:

ρ	=	*Water density (= 8.33 lbs/gallons)*
C_p	=	*Specific heat of water (= 1 Btu/lb·°F)*
GPY	=	*Estimated annual hot water use in gallons/year, specified by number of bedrooms in the home (see Table 2-396)*

Table 2-396: Water Heater Consumption (gal/year)*

Climate Zone		Number of Bedrooms			
		1	2	3	4
1	Panhandle	15,476	20,171	24,866	29,561
2	North	14,778	19,244	23,710	28,177
3	South	14,492	18,864	23,236	27,608
4	Valley	14,213	18,494	22,775	27,056
5	West	14,905	19,412	23,920	28,427

* Building America Research Benchmark Definition. December 2009. Available online: http://www.nrel.gov/docs/fy10osti/47246.pdf.

$T_{SetPoint}$ = *Water heater set point (= 120°F)*[246]

$T_{Supply,ann}$ = *Annual average mains temperature from Table 2-397*

EF_{pre} = *Baseline energy factor (see Table 2-395 or calculate per Table 2-393)*[247]

EF_{post} = *Energy factor of new water heater*

3,412 = *Constant to convert from Btu to kWh*

Table 2-397: Water Mains Temperature*

Climate Zone		Water Mains Temperature (°F)		
		$T_{supply,annual}$	$T_{supply,seasonal}$	
			Summer	Winter
1	Panhandle	62.9	73.8	53.7
2	North	71.8	84.0	60.6
3	South	74.7	84.5	65.5
4	Valley	77.2	86.1	68.5
5	West	70.4	81.5	60.4

* Based on TMY3 dataset: http://rredc.nrel.gov/solar/old_data/nsrdb/1991-2005/tmy3/.

246 120°F represents the assumed water heater setpoint. The New York Department of Public Service recommends using the water heater setpoint as a default value, see "New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs." Page 99. October 2010. The data collection discussed in Appendix D of the EM&V team's Annual Statewide Portfolio Report for Program Year 2014-Volume 1, Project Number 40891 (August 2015) also supports a default value of 120°F.

247 Note that for efficient water heater installations in newly-constructed homes, the baseline energy factor is the efficiency of the electric storage water heater that would otherwise have been installed, according to appropriate design documentation.

Demand Savings Algorithm

$$kW_{savings,summer} = Ratio_{daily\ gal}^{summer\ peak\ gal} \frac{\rho \times C_p \times GPY \times (T_{setpoint} - T_{supply,summer}) \times \left(\frac{1}{EF_{pre}} - \frac{1}{EF_{post}}\right)}{365 \times 3{,}412}$$

Equation 96

$$kW_{savings,winter} = Ratio_{daily\ gal}^{winter\ peak\ gal} \frac{\rho \times C_p \times GPY \times (T_{setpoint} - T_{supply,winter}) \times \left(\frac{1}{EF_{pre}} - \frac{1}{EF_{post}}\right)}{365 \times 3{,}412}$$

Equation 97

Where:

$\mathrm{Ratio}_{\mathrm{dailygal}}^{\mathrm{Sumpeakgal}}$ = *Ratio of hot water use during the typical summer peak hour (4:00 p.m. to 5:00 p.m.) to daily hot water use (= 0.0436)*

$\mathrm{Ratio}_{\mathrm{dailygal}}^{\mathrm{Winpeakgal}}$ = *Ratio of average hot water use during the winter peak hour (7:00 a.m. to 8:00 a.m.) to daily hot water use (= 0.0794)*

$\mathrm{T}_{\mathrm{Supply,sum}}$ = *Summer average water mains temperature (see Table 2-397)*

$\mathrm{T}_{\mathrm{Supply,win}}$ = *Winter average water mains temperature (see Table 2-397)*

Gas Storage or Tankless Water Heater (Fuel Substitution)

Energy and demand savings awarded for replacing an electric water heater with a gas storage or gas tankless water heater are equal to the consumption of the unit replaced.

For gas storage water heaters with a tank size greater than 55 gallons, or gas tankless water heaters replacing a unit greater than 55 gallons, the appropriate baseline is a HPWH. The baseline consumption values are calculated using the federal standard baseline condition specified in the Heat Pump Water Heater measure. Savings for gas water heaters larger than 55 gallons are shown in Table 2-398 through Table 2-400.

Energy Savings Algorithm for Units Less than 55 Gallons

$$kWh_{savings} = \frac{\rho \times C_p \times GPY \times (T_{setpoint} - T_{supply,annual}) \times \left(\frac{1}{EF_{pre}}\right)}{3{,}412}$$

Equation 98

Demand Savings Algorithm for Units Less than 55 Gallons

$$SummerkW_{savings} = Ratio_{daily\ gal}^{summer\ peak\ gal} \times \frac{\rho \times C_p \times GPY \times (T_{setpoint} - T_{supply,summer}) \times \left(\frac{1}{EF_{pre}}\right)}{365 \times 3{,}412}$$

Equation 99

$$WinterkW_{savings} = Ratio_{daily\ gal}^{winter\ peak\ gal} \times \frac{\rho \times C_p \times GPY \times (T_{setpoint} - T_{supply,winter}) \times \left(\frac{1}{EF_{pre}}\right)}{365 \times 3{,}412}$$

Equation 100

Examples

Example 1. An old 40-gallon electric water heater in a two-bedroom home in Dallas is replaced with a new, tankless electric water heater with an energy factor of 0.99.

$$kWh_{savings} = \frac{\left[8.33 \times 1 \times 19{,}244 \times (120 - 71.8) \times \left(\frac{1}{0.948} - \frac{1}{0.99}\right)\right]}{3{,}412} = \textit{101 kWh}$$

$$kW_{savings,summer} = 0.0436 \times \frac{\left[8.33 \times 1 \times 19{,}244 \times (120 - 84) \times \left(\frac{1}{0.948} - \frac{1}{0.99}\right)\right]}{365 \times 3{,}412} = 0.01\ kW$$

$$kW_{savings,winter} = 0.0794 \times \frac{\left[8.33 \times 1 \times 19{,}244 \times (120 - 60.6) \times \left(\frac{1}{0.948} - \frac{1}{0.99}\right)\right]}{365 \times 3{,}412} = 0.03\ kW$$

Example 2. An old 30-gallon electric water heater in a one-bedroom house in El Paso is replaced with a new gas storage water heater with an energy factor of 0.65.

$$kWh_{savings} = \frac{\left[8.33 \times 1 \times 14{,}905 \times (120 - 70.4) \times \left(\frac{1}{0.951}\right)\right]}{3{,}412} = \textit{1,898 kWh}$$

$$kW_{savings,summer} = 0.0436 \times \frac{\left[8.33 \times 1 \times 14{,}905 \times (120 - 81.5) \times \left(\frac{1}{0.951}\right)\right]}{365 \times 3{,}412} = 0.18\ kW$$

$$kW_{savings,winter} = 0.0794 \times \frac{\left[8.33 \times 1 \times 14{,}905 \times (120 - 60.4) \times \left(\frac{1}{0.951}\right)\right]}{365 \times 3{,}412} = 0.50\ kW$$

Example 3. An old electric water heater in a two-bedroom house in Corpus Christi is replaced with a new 65-gallon gas storage water heater in a home with gas heat.

$$kWh_{savings} = \textit{1,558 kWh}$$

$$kW_{savings,summer} = 0.14\ kW$$

$$kW_{savings,winter} = 0.33\ kW$$

Deemed Energy Savings Tables

Energy savings for gas water heaters with tanks greater than 55 gallons (or gas tankless units replacing a unit greater than 55 gallons) are provided in Table 2-398.

Table 2-398: HPWH Baseline Energy Consumption (kWh) for Gas DHW with > 55 Gallon Tanks

Climate Zone	Tank Size (Gal)	Water Heater Location/Heat Type			
		Conditioned Space			Unconditioned Space
		Gas Heat	Electric Resistance	Heat Pump	
1	55 - 64	1,873	1,059	1,520	1,830
	65 - 74	2,137	1,303	1,775	2,102
	75 +	2,403	1,550	2,033	2,378
2	55 - 64	1,553	984	1,306	1,396
	65 - 74	1,762	1,180	1,509	1,604
	75 +	1,973	1,378	1,715	1,814
3	55 - 64	1,467	906	1,223	1,249
	65 - 74	1,659	1,087	1,411	1,435
	75 +	1,853	1,270	1,600	1,623
4	55 - 64	1,382	1,050	1,238	1,135
	65 - 74	1,558	1,219	1,411	1,304
	75 +	1,736	1,390	1,586	1,474
5	55 - 64	1,585	1,015	1,338	1,457
	65 - 74	1,803	1,219	1,549	1,674
	75 +	2,022	1,426	1,763	1,893

Deemed Summer Demand Savings Tables

Summer demand savings for gas water heaters with tanks greater than 55 gallons (or gas tankless units replacing a unit greater than 55 gallons) are provided in Table 2-399.

Table 2-399: HPWH Baseline Summer Demand (kW) for Gas DHW with > 55 Gallon Tanks

Climate Zone	Tank Size (gal)	Water Heater Location	
		Conditioned Space	Unconditioned Space
1	55 - 64	0.19	0.14
	65 - 74	0.21	0.16
	75 +	0.23	0.18
2	55 - 64	0.13	0.08
	65 - 74	0.14	0.09
	75 +	0.16	0.1
3	55 - 64	0.13	0.08
	65 - 74	0.15	0.1
	75 +	0.16	0.11
4	55 - 64	0.12	0.08
	65 - 74	0.14	0.09
	75 +	0.15	0.1
5	55 - 64	0.13	0.09
	65 - 74	0.14	0.1
	75 +	0.16	0.11

Deemed Winter Demand Savings Tables

Winter demand savings for gas water heaters with tanks greater than 55 gallons (or gas tankless units replacing a unit greater than 55 gallons) are provided in Table 2-400.

Table 2-400: HPWH Baseline Winter Demand (kW) for Gas DHW with > 55 Gallon Tanks

Climate Zone	Tank Size (gal)	Water Heater Location/Heat Type			
		Conditioned Space			Unconditioned Space
		Gas Heat	Electric Resistance	Heat Pump	
1	55 - 64	0.40	0.13	0.28	0.44
	65 - 74	0.46	0.19	0.34	0.51
	75 +	0.52	0.24	0.40	0.57
2	55 - 64	0.36	0.1	0.25	0.38
	65 - 74	0.41	0.15	0.30	0.44
	75 +	0.47	0.2	0.35	0.50
3	55 - 64	0.33	0.07	0.22	0.38
	65 - 74	0.38	0.11	0.26	0.44
	75 +	0.43	0.16	0.31	0.50

	65 - 74	0.38	0.12	0.27	0.44
	75 +	0.43	0.16	0.31	0.50

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The average EULs for installed equipment are: 20 years for a tankless water heater (gas or electric) and 11 years for a high efficiency gas water heater.

These values are consistent with the EULs reported in the 2014 California DEER.[248]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Volume of the replacement water heater (gallons, zero if tankless)
- Volume of the existing water heater (gallons)
- Energy factor of the replacement water heater
- Number of bedrooms
- Form signed by customer and utility representative indicating planned electric storage water heater installation (New Construction only)
- Design documents indicating planned electric storage water heater installation (New Construction only)

Document Revision History

Table 2-401: Residential Water Heater Installations Revision History

TRM Version	Date	Description of Change
v1.0	11/25/2013	TRM v1.0 origin.
v2.0	04/18/2014	TRM v2.0 update. Updated measure to require electric tankless rather than electric storage water heater installation for non-fuel-switching option. Updated by Frontier Associates, March 2014, based on new federal standards.
v2.1	01/30/2015	TRM v2.1 update. Updated to reflect that new construction permitted to claim savings subject to documentation requirements, and that gas-fueled tankless water heaters are eligible for installation.
v3.0	04/10/2015	TRM v3.0 update. Amended fuel substitution savings to reflect the full consumption of the electric unit being replaced. Revised demand savings for installing an electric tankless unit to reflect daily usage patterns.
v3.1	11/05/2015	TRM v3.1 update. Clarified baseline for water heaters greater than 55 gallons.
v4.0	10/10/2016	TRM v4.0 update. Updated HPWH baseline usage for gas storage water heaters larger than 55 gallons.
v5.0	10/2017	TRM v5.0 update. No revision.
v6.0	11/2018	TRM v6.0 update. No revision.

2.4.6 Heat Pump Water Heaters Measure Overview

TRM Measure ID: R-WH-HW

Market Sector: Residential

Measure Category: Water Heating

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity and gas

Decision/Action Type(s): Replace-on-burnout

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Engineering algorithms and estimates

Measure Description

The residential heat pump water heater (HPWH) measure involves the installation of an integrated or "drop-in" ENERGY STAR® HPWH. Deemed savings values are presented on a per-unit basis. Deemed savings variables include storage tank volume, first hour rating, and HPWH installation location (in conditioned or unconditioned space). In addition, this measure accounts for the interactive air conditioning energy savings and heating penalty associated with the HPWH when installed inside conditioned space.[249]

These deemed savings are calculated using the amended federal standards for electric consumer water heaters effective April 16, 2015.

Eligibility Criteria

This measure applies to residential, electric, storage-type heat pump water heaters. Heat pump add-ons to existing storage water heaters are ineligible. The measure does not apply to the replacement of gas water heaters.

These deemed savings are for Heat Pump Water Heaters installed as a replace-on-burnout measure or as an early retirement measure in existing homes. However, savings are calculated under the assumption of replace-on-burnout.

[249] Interaction with space heating equipment only affects deemed savings for units below 55 gallons. This is because the measure assumes replace on burnout and because the latest manufacturer standards effectively require heat pump water heaters (assuming electric water heating) for residential units with storage tank size greater than 55 gallons. For these units any interaction with the space conditioning systems are essentially the same for base and change case systems, so they cancel each other out.

Baseline Condition

The baseline condition is an electric storage water heater (EWH) with baseline efficiency (Uniform Energy Factor – UEF) determined by tank size and draw pattern – a proxy for first hour rating – based on the amended federal energy efficiency standards for residential water heaters with tank sizes 20–120 gallons, as published in 10 CFR Part 430.32 of the Federal Register:[250]

Table 2-402: Federal Standard for Residential Water Heaters

Rated Storage Volume	Draw Pattern	First Hour Rating (FHR)	Uniform Energy Factor[251]
≥ 20 gal and ≤ 55 gal	Very Small Usage	$0 \le FHR < 18$	$0.8808 - (0.0008 \times V_r)$
	Low Usage	$18 \le FHR < 51$	$0.9254 - (0.0003 \times V_r)$
	Medium Usage	$51 \le FHR < 75$	$0.9307 - (0.0002 \times V_r)$
	High Usage	$75 \le FHR$	$0.9349 - (0.0001 \times V_r)$
> 55 gal and ≤ 120 gal	Very Small Usage	$0 \le FHR < 18$	$1.9236 - (0.0011 \times V_r)$
	Low Usage	$18 \le FHR < 51$	$2.0440 - (0.0011 \times V_r)$
	Medium Usage	$51 \le FHR < 75$	$2.1171 - (0.0011 \times V_r)$
	High Usage	$75 \le FHR$	$2.2418 - (0.0011 \times V_r)$

Because there are no listed Energy Star water heaters in the *very small usage* and *low usage* draw pattern categories, they are not relevant to this measure. Discarding these draw patterns and applying average tank volumes within four strata of storage tank sizes, application of this equation provides the following baseline efficiency levels for residential electric storage water heaters.

Table 2-403: Heat Pump Water Heaters—Minimum Required Uniform Energy Factors

Usage Rate	Tank Size (Gallons)			
	45	65	75	82
Medium Usage	0.922	2.046	2.035	2.027
High Usage	0.930	2.170	2.159	2.152

The new DOE efficiency standard effectively requires heat pump water heaters (assuming electric water heating) for storage water heaters with tank size greater than 55 gallons. As such, the baseline technology for water heaters with tanks greater than 55 gallons is a heat pump water heater. For smaller systems, the baseline technology remains an electric storage water heater with electric resistance as the primary heat source. This baseline assumes a replace-on-burnout scenario.

250 *10 CFR Part 430.32 Energy and water conservation standards and their effective dates*. Online. Available: www.ecfr.gov/cgi-bin/text-idx?SID=80dfa785ea350ebeee184bb0ae03e7f0&mc=true&node=se10.3.430_132&rgn=div8. Accessed September 2018.

251 Vr is the Rated Storage Volume (in gallons), as determined pursuant to 10 CFR 429.17.

High-Efficiency Condition

The efficient condition is a heat pump water heater certified by Energy Star ® with Uniform Energy Factor (UEF) greater than 2.3.[252] A complete list of certified Energy Star heat pump water heaters can be accessed via the Energy Star program website.[253]

Heat pump water heaters depend on adequate ventilation for proper functioning, including adequate space for both inlet and outlet air flow, and should be installed in spaces in which temperature does not drop below a certain level. The Department of Energy recommends installation in locations that remain above 40°F year-round and provide a minimum of 1,000 cubic feet of air space around the water heater.[254]

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

The following variables specify the appropriate deemed demand and energy savings values for a given project:

- Climate zone
- HPWH tank size
- HPWH first hour rating
- HPWH installed location (Conditioned vs. Unconditioned Space)
- For HPWH installations in conditioned space, the building heating type (electric resistance, air-source heat pump, or gas furnace)

Deemed savings are estimated using the average uniform energy factor (UEF) of ENERGY STAR certified systems with UEF > 2.3 by storage tank size strata and first hour rating/usage draw pattern according to the list of certified products available in August 2018.[255]

---

252 ENERGY STAR® Requirements (as of April 2015): HPWH must have nominal input of 75,000 BTU/h or less, a maximum current rating of 24 amperes, voltage no greater than 250 volts, and a transfer of thermal energy from one temperature to a higher temperature level for the purpose of heating water. Unit must have "integrated" or "drop-in" configuration. EF ≥ 2.0 for units ≤ 55 gal, EF ≥ 2.20 for units > 55 gal, first-hour rating (FHR) ≥ 50 gallons/hour, Warranty ≥ 6 years on sealed systems, Safety UL 174 and UL 1995. . See: https://www.energystar.gov/products/water_heaters/residential_water_heaters_key_product_criteria.

253 ENERGY STAR Certified Water Heaters. Online. Available: https://www.energystar.gov/productfinder/product/certified-water-heaters/?scrollTo=721.5999755859375&search_text=&fuel_filter=Electric&type_filter=Heat+Pump&brand_name_isopen=&input_rate_thousand_btu_per_hour_isopen=&markets_filter=United+States&zip_code_filter=&product_types=Select+a+Product+Category&sort_by=uniform_energy_factor_uef&sort_direction=asc&currentZipCode=1871&page_number=0&lastpage=0

254 Heat Pump Water Heaters. Department of Energy, May 2012. Online. Available: http://energy.gov/energysaver/articles/heat-pump-water-heaters. Accessed: February 22, 2013.

255 As of August 2018, the ENERGY STAR® products list includes 115 residential heat pump water heaters with UEF >2.3.

Deemed Energy Savings Tables

Deemed savings are developed for heat pump water heaters in four size ranges: less than or equal to 55 gallons, 56-69 gallons, 70-79 gallons, and 80 gallons or more. These sizes correspond to the four basic sizes of HPWHs commercially available at the time these deemed savings were developed, according to review of manufacturer data provided on the ENERGY STAR® and AHRI websites. Table 2-404 presents the deemed energy savings tables for medium usage HPWHs for the five Texas climate zones. This table assumes a replace-on-burnout scenario but may be used to award savings for early retirement projects.

Table 2-404: Medium Usage Residential HPWH Deemed Annual Energy Savings (kWh)

Climate Zone		HPWH Tank Size Range (Gallons)	Conditioned Space			Unconditioned Space
			Gas Heat	Electric Resistance	Heat Pump	
1	Panhandle	<55	2,244	1,450	1,899	2,102

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The Estimated Useful Life for this measure is 13 years. This EUL is consistent with the judgment of the American Council for an Energy-Efficient Economy as listed on its website.[256]

[256] Water Heating. American Council for an Energy Efficient Economy. Online. Available: http://www.aceee.org/consumer/water-heating. Accessed: September 2011.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Approximate volume of the replacement heat pump water heater tank in gallons
- Baseline uniform energy factor (UEF)
- UEF of the replacement water heater
- First hour rating (FHR) of the replacement water heater
- Water heater type (e.g., heat pump, electric resistance)
- Installed location (conditioned vs. unconditioned space)
- For heat pump water heater installations in conditioned space, the building heating type (electric resistance, air-source heat pump, or gas furnace)

2.4.7 Solar Water Heaters Measure Overview

TRM Measure ID: R-WH-SW

Market Sector: Residential

Measure Category: Water Heating

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Engineering algorithms and estimates

Measure Description

Solar water heating deemed savings values are calculated based on the Solar Rating and Certification Corporation's (SRCC) test for solar water heaters (test OG-300).

Eligibility Criteria

These deemed savings are for solar water heaters installed as a replace-on-burnout measure or as an early retirement measure in existing homes. However, savings are calculated under the assumption of replace-on-burnout.

Baseline Condition

This section is not applicable.

High-Efficiency Condition

Only solar water heaters meeting the SRCC OG-300 standard (based on tank size and final Solar Energy Factor-SEF) qualify for these deemed savings estimates.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Solar water heating values are on a per-unit basis. Deemed savings variables include tank volume and installed-unit Solar Energy Factor (SEF) as rated in the Solar Rating and

Certification Corporation (SRCC) "Summary of SRCC Certified Solar Collector and Water Heating System Ratings." The Solar Energy Factor (SEF) is determined under SRCC's Operating Guideline 300, "Operating Guidelines and Minimum Standards for Certifying Solar Water Heating Systems" and was developed as a means to compare solar water heating systems with conventional water heating systems rated with an Energy Factor (EF) and listed in the Gas Appliance Manufacturers Association Directory of Certified Water Heating Products.

Both EF and SEF are based on the same environmental and hot water use conditions used in the DOE Test Procedures for Water Heaters. The only significant difference is that the DOE test does not specify solar radiation. So SRCC uses a 1500 Btu/sq.ft./day solar radiation profile—a value typical of Sunbelt states (note - the annual average solar radiation for Dallas is 1533 Btu/sq.ft./day. (Information on the SRCC can be found at http://www.solar-rating.org/.)

Examples

A passive Sun Earth CP-40 with a SEF of 1.4 would consume 2133 kWh (2987/1.4), saving 1323 kWh compared to a baseline 50-gallon water heater that consumes 3458 kWh (values based on Frontier data).

An active Heliotype HP 410 G 80 with a SEF of 2.0 would consume 1494 kWh (2987/2), saving 1965 kWh compared to the baseline 50-gallon water heater.

Use SRCC OG-300 Test to Obtain SEF

SRCC = Solar Rating and Certification Corporation

OG-300 = test standard for SWH systems

SEF = Solar Energy Factor

Calculate kWh Savings

$$kWh\ savings = standard\ load \times \left(1 - \frac{EF}{SEF}\right) = (3{,}458) \times \left(1 - \frac{0.864}{2}\right) = 1{,}965 kWh$$

Deemed Energy Savings Tables

Deemed Summer Demand Savings Tables

The following table presents the demand savings for solar water heaters.

Table 2-412: Solar Water Heating Demand Savings (kW)

Solar Water Heating Demand Savings kW
0.42

- Diversified value fully displaced during solar peak.
- This value is consistent with Univ. of Texas study (0.4).

Deemed Winter Demand Savings Tables

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on winter peak demand savings and methodology.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) of a solar water heater is established at 15 years.

This value is consistent with the EUL reported in the 2014 California Database for Energy Efficiency Resources (DEER).[257]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- The approximate volume of the replacement water heater in gallons
- SRCC OG-300 Solar Energy Factor of the replacement unit

2.4.8 Showerhead Temperature Sensitive Restrictor Valves Measure Overview

TRM Measure ID: R-WH-SV

Market Sector: Residential

Measure Category: Water Heating

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity, Gas

Decision/Action Type(s): Retrofit, New Construction

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure consists of installing a temperature sensitive restrictor valve (TSRV)[258] between the existing shower arm and showerhead. The valve will restrict hot water flow through the showerhead once the water reaches a set temperature (generally 95˚F) to prevent water from going down the drain prior to the user entering the shower, thereby eliminating behavioral waste.

Eligibility Criteria

The incentive is for installment of a temperature sensitive restrictor valve between the existing shower arm and showerhead.

These deemed savings are for temperature sensitive restrictor valves installed in new construction or as a retrofit measure in existing homes. In order to be awarded these deemed savings, the fuel type of the water heater must be electricity or gas.

Baseline Condition

The baseline condition is the residential shower arm and standard (2.5 gpm) showerhead without a temperature sensitive restrictor valve installed.

[258] A temperature sensitive restrictor valve is any device that uses water temperature to regulate water flow in showers.

High-Efficiency Condition

To qualify for temperature sensitive restrictor valve deemed savings, the installed equipment must be a temperature sensitive restrictor valve installed on a residential shower arm and showerhead with either a standard (2.5 gpm) or low-flow (2.0, 1.75, or 1.5 gpm) showerhead. If this measure is installed in conjunction with a low-flow showerhead, refer to the Low-Flow Showerheads measure and claim additional savings as outlined in that measure.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Estimated Hot Water Usage Reduction

Baseline and efficiency-standard water usages per capita were derived from an analysis of metered studies of residential water efficiency retrofit projects conducted for Seattle, WA; the East Bay Municipal Utility District (CA); and Tampa, FL.[259,260,261]

To determine gallons of behavioral waste (defined as hot water that goes down the drain before the user enters the shower) per year, the following formula was used:

$$Annual\ Showerhead\ Behavioral\ Waste = SHFR \times BW \times n_S \times 365\ \frac{days}{year} \times \frac{n_O}{n_{SH}}$$

Equation 101

Where:

SHFR	=	*Showerhead flow rate, gallons per minute (gpm) (see Table 2-414)*
$BW\mathrm{C_P}$	=	*Behavioral waste, minutes per shower (see Table 2-414)*
$n_S\mathrm{C_P}$	=	*Number of showers per person per day (see Table 2-414)*
$365\mathrm{C_P}$	=	*Constant to convert days to years (see Table 2-414)*
$n_O\mathrm{C_P}$	=	*Number of occupants per home (see Table 2-414)*
$n_{SH}\mathrm{C_P}$	=	*Number of showerheads per home (see Table 2-414)*

[259] Seattle Home Water Conservation Study: "The Impacts of High Efficiency Plumbing Fixture Retrofits in Single-Family Homes." December 2000. http://allianceforwaterefficiency.org/WorkArea/linkit.aspx?LinkIdentifier=idandItemID=856.

[260] Residential Indoor Water Conservation Study: "Evaluation of High Efficiency Indoor Plumbing Fixture Retrofits in Single-Family Homes in the East Bay Municipal Utility District Service Area." July 2003. http://www.ebmud.com/sites/default/files/pdfs/residential_indoor_wc_study_0.pdf.

[261] Tampa Water Department Residential Water Conservation Study: "The Impacts of High Efficiency Plumbing Fixture Retrofits in Single-Family Homes." January 8, 2004. www.cuwcc.org/WorkArea/downloadasset.aspx?id=12162.

Applying the formula to the values used for Texas from Table 2-414 returns the following values for baseline behavioral waste in gallons per showerhead per year:

$$Showerhead\ (2.5\ GPM): 2.5 \times\ 0.783 \times 0.72 \times 365 \times \frac{2.79}{1.68} = 854\ gal$$

$$Showerhead\ (2.0\ GPM): 2.0 \times 0.783 \times 0.72 \times 365 \times \frac{2.79}{1.68} = 683\ gal$$

$$Showerhead\ (1.75\ GPM): 1.75 \times 0.783 \times 0.72 \times 365 \times \frac{2.79}{1.68} = 598\ gal$$

$$Showerhead\ (1.5\ GPM): 1.5 \times 0.783 \times 0.72 \times 365 \times \frac{2.79}{1.68} = 513\ gal$$

Gallons of hot water saved per year can be found by multiplying the baseline behavioral waste gallons per year by the percent of hot water from Table 2-414.

$$Gallons\ of\ hot\ water\ saved\ per\ year = \ Annual\ Behavioral\ Waste \times HW\%$$

Equation 102

Where:

HW% = *Hot water percentage (see Table 2-414)*

$$Gallons\ of\ hot\ water\ saved\ per\ year\ (2.5\ GPM): 854 \times\ 0.825 = 705\ gal$$

$$Gallons\ of\ hot\ water\ saved\ per\ year\ (2.0\ GPM): 683 \times\ 0.825 = 563\ gal$$

$$Gallons\ of\ hot\ water\ saved\ per\ year\ (1.75\ GPM): 598 \times\ 0.825 = 493\ gal$$

$$Gallons\ of\ hot\ water\ saved\ per\ year\ (1.5\ GPM): 513 \times\ 0.825 = 423\ gal$$

Table 2-414: Estimated Showerhead with TSRV Hot Water Usage Reduction

Description	2.5 gpm	2.0 gpm	1.75 gpm	1.5 gpm
Average behavioral waste (minutes per shower)[262]	0.783	0.783	0.783	0.783
Showers/person/day[263]	0.72	0.72	0.72	0.72
Occupants per home[264]	2.79	2.79	2.79	2.79
Showerheads per home[265]	1.68	1.68	1.68	1.68
Gallons behavioral waste per showerhead per year	1,018	814	713	611

[262] Average behavioral waste from Lutz (2004) Feasibility Study and Roadmap to Improve Residential Hot Water Distribution Systems and Sherman (2014) Disaggregating Residential Shower Warm-Up Waste. Derived by dividing 47 seconds by 60 seconds.

[263] Occupants per home for Texas from US Census Bureau, Texas, "Persons per household, 2007-2011." Accessed January 2013 http://quickfacts.census.gov/qfd/states/48000.html.

[264] Derivation of value for showers per person per day defined in the Low Flow Showerhead measure.

[265] Showerheads per home assumed to be equal to the number of full bathrooms per home, taken from 2009 RECS, Table HC2.10.

Description	2.5 gpm	2.0 gpm	1.75 gpm	1.5 gpm
Percent hot water[266]	82.5%	82.5%	82.5%	82.5%
Gallons hot water saved per year	705	563	493	423

Energy Savings Algorithms

Energy savings for this measure are calculated as follows:

$$Energy\ Savings\ per\ TSRV = \frac{\rho \times C_P \times V \times (T_{SetPoint} - T_{SupplyAverage})}{RE \times Conversion\ Factor}$$

Equation 103

Where:

ρ = *Water density, 8.33 lbs/gallon*

C_P = *Specific heat of water, 1 Btu/lb°F*

V = *Gallons of hot water saved per year per showerhead (see Table 2-414)*

$T_{SetPoint}$ = *Water heater setpoint: 120°F* [267]

T_{Supply} = *Average supply water temperature (see Table 2-415)*

RE = *Recovery Efficiency (or in the case of heat pump water heaters, COP). If unknown, use 0.98 as a default for electric resistance water heaters, 2.2 for heat pump water heaters, or 0.8 for gas hot water heaters.* [268]

$ConversionFactor$ = *3,412 Btu/kWh for electric or 100,000 Btu/therm for gas*

---

[266] Average percent hot water from (Lutz 2004) Feasibility Study and Roadmap to Improve Residential Hot Water Distribution Systems and (Sherman 2015) Calculating Savings For: Auto-Diverting Tub Spout System with ShowerStart TSV.

[267] 120°F represents the assumed water heater setpoint. New York Department of Public Service recommends using water heater setpoint as a default value, see “New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs” October 2010, page 99.
Data collection discussed in Appendix D of the EM&V team’s Annual Statewide Portfolio Report for Program Year 2014-Volume 1, Project Number 40891 (August 2015), also supports a default value of 120°F.

[268] Default values based on median recovery efficiency of residential water heaters by fuel type in the AHRI database, at http://cafs.ahrinet.org/gama_cafs/sdpsearch/search.jsp?table=CWH.

Demand Savings Algorithms

Demand savings will be calculated using the following formula:

$$Demand\ Savings\ per\ TSRV = \frac{\rho \times C_P \times V \times (T_{SetPoint} - T_{SupplySeasonal})}{RE \times Conversion\ Factor} \times Ratio_{annual\ kWh}^{Peak_{seasonal}kW}$$

Equation 104

Where:

$T_{SupplySeasonal}$ = *Seasonal supply water temperature (see Table 2-415)*

$Ratio_{annual\ kWh}^{Peak_{seasonal}kW}$ = *Ratio of peak seasonal kW to annual kWh savings (see Table 2-416)*

Table 2-415: Water Mains Temperature

Climate Zone	Water Mains Temperature (°F)[269]		
	$T_{SupplyAverage}$	$T_{SupplySeasonal}$	
		Summer	Winter
Climate Zone 1: Panhandle	62.9	73.8	53.7
Climate Zone 2: North	71.8	84.0	60.6
Climate Zone 3: South	74.7	84.5	65.5
Climate Zone 4: Valley	77.2	86.1	68.5
Climate Zone 5: West	70.4	81.5	60.4

Table 2-416: Water Fixture Peak Demand Ratios

Peak Demand Ratios[270]	
Summer	Winter
0.000110	0.000274

The fixture peak demand ratios were derived by taking the fraction hot water use during the peak hour (summer: 4-5pm, winter: 7-8am) to the total daily usage from the Building America Performance Analysis Procedures for Existing Homes, and dividing it by the number of days per year (365). The fraction of hot water use during the winter peak hour to total daily water usage is 0.1: $0.1/365 = 0.000274$. The summer peak hour to total daily water usage is 0.04: $0.04/365 = 0.000110$.

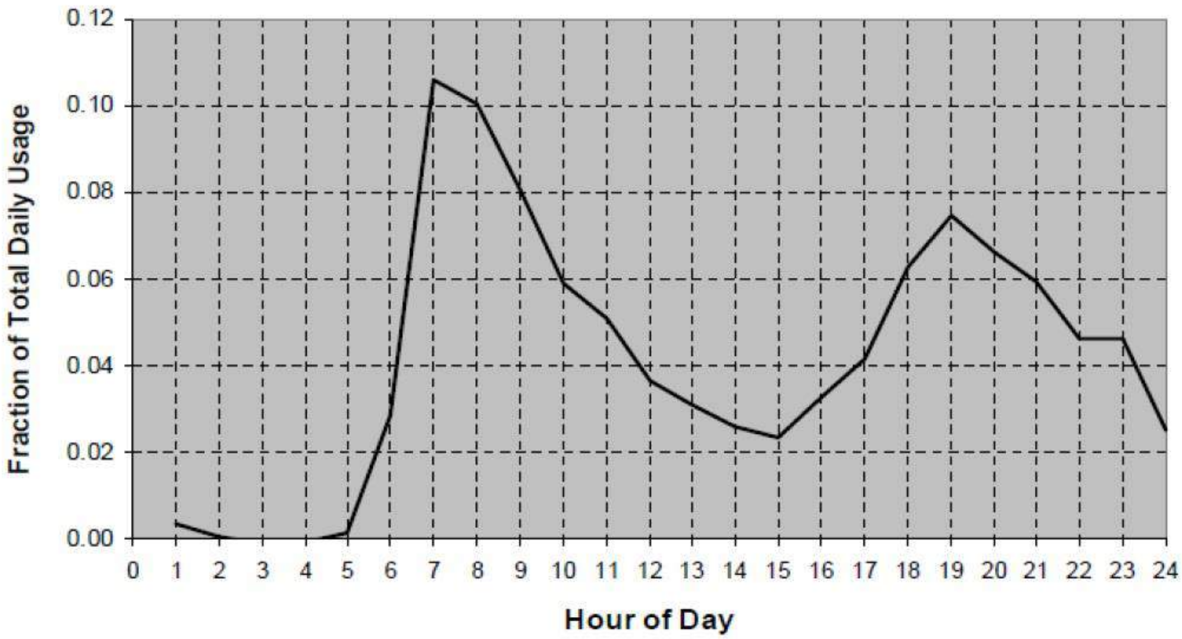
Figure 2-8: Shower, Bath, and Sink Hot Water Use Profile



Source: Building America Performance Analysis Procedures for Existing Homes.

Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) for this measure is established at 10 years.

This value is consistent with the EUL reported for a low-flow showerhead in the 2014 California Database for Energy Efficiency Resources (DEER).[271]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Recovery Efficiency (RE) or COP, if available
- Flow rate in gallons per minute (gpm) of showerhead installed
- Water heater type (e.g., heat pump, electric resistance)

2.4.9 Tub Spout and Showerhead Temperature Sensitive Restrictor Valves Measure Overview

TRM Measure ID: R-WH-TV

Market Sector: Residential

Measure Category: Water Heating

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity, Gas

Decision/Action Type(s): Retrofit, new construction

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure consists of replacing existing tub spouts and shower heads with an automatically diverting tub spout and showerhead system with a temperature sensitive restrictor valve (TSRV) [272] between the existing shower arm and showerhead. The tub spout will contain temperature sensitive restrictor technology that will cause the tub spout to automatically engage the anti-leak diverter once the water reaches a set temperature (generally 95˚F). The water will divert to a showerhead with a normally closed valve that will prevent the hot water from going down the drain prior to the user entering the shower, thereby eliminating behavioral waste and tub spout leakage waste.

Eligibility Criteria

The incentive is for installment of an automatically diverting tub spout and showerhead system with temperature sensitive restrictor technology.

These deemed savings are for tub spout and showerhead systems with temperature sensitive restrictor technology installed in new construction or as a retrofit measure in existing homes. In order to be awarded these deemed savings, the fuel type of the water heater must be electricity or gas.

[272] A temperature sensitive restrictor valve is any device that uses water temperature to regulate water flow in showers.

Baseline Condition

The baseline condition is the residential tub spout with a standard diverter, and a standard (2.5 gpm) showerhead.

High-Efficiency Condition

To qualify for tub spout and showerhead system with temperature sensitive restrictor technology deemed savings, the installed equipment must be an anti-leak, automatically diverting tub spout system with temperature sensitive restrictor technology installed on a residential shower arm and showerhead with a standard (2.5 gpm) or low-flow (2.0, 1.75, or 1.5 gpm) showerhead. If this measure is installed in conjunction with a low-flow showerhead, refer to the Low-Flow Showerheads measure and claim additional savings as outlined in that measure.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Estimated Hot Water Usage Reduction

Baseline and efficiency-standard water usages per capita were derived from an analysis of metered studies of residential water efficiency retrofit projects conducted for Seattle, WA; the East Bay Municipal Utility District (CA); and Tampa, FL.[273,274,275]

This system provides savings in two parts: elimination of behavioral waste (hot water that goes down the drain prior to the user entering the shower) and elimination of tub spout diverter leakage.

Part 1: To determine baseline gallons of behavioral waste per year, the following formula was used:

$$Annual\ Showerhead\ Behavioral\ Waste = \%WUE_{SH} \times SHFR \times BW \times n_S \times 365\ \frac{days}{year} \times \frac{n_O}{n_{SH}}$$

Equation 105

$$Annual\ Tub\ Spout\ Behavioral\ Waste = \%WUE_{TS} \times TSFR \times BW \times n_S \times 365\ \frac{days}{year} \times \frac{n_O}{n_{SH}}$$

Equation 106

274 Residential Indoor Water Conservation Study: “Evaluation of High Efficiency Indoor Plumbing Fixture Retrofits in Single-Family Homes in the East Bay Municipal Utility District Service Area.” July 2003. http://www.ebmud.com/sites/default/files/pdfs/residential_indoor_wc_study_0.pdf.

275 Tampa Water Department Residential Water Conservation Study: “The Impacts of High Efficiency Plumbing Fixture Retrofits in Single-Family Homes.” January 8, 2004. www.cuwcc.org/WorkArea/downloadasset.aspx?id=12162.

Where:

$\%WUE_{SH}$	=	*Showerhead percentage of warm-up events (see Table 2-418)*
$\%WUE_{TS}$	=	*Tub spout percentage of warm-up events (see Table 2-418)*
SHFR	=	*Showerhead flow rate, gallons per minute (gpm) (see Table 2-418)*
TSFR	=	*Tub spout flow rate, gallons per minute (gpm) (see Table 2-418)*
$BW\mathrm{C_P}$	=	*Behavioral waste, minutes per shower (see Table 2-418)*
$n_S\mathrm{C_P}$	=	*Number of showers per person per day (see Table 2-418)*
$365\mathrm{C_P}$	=	*Constant to convert days to years (see Table 2-418)*
$n_O\mathrm{C_P}$	=	*Number of occupants per home (see Table 2-418)*
$n_{SH}\mathrm{C_P}$	=	*Number of showerheads per home (see Table 2-418)*

Applying the formula to the values used for Texas from Table 2-418 returns the following values:

$$Showerhead\ (1.5\ GPM): 0.6 \times \left(1.5 \times 0.783 \times 0.72 \times 365 \times \frac{2.79}{1.68}\right) = 308$$

$$Showerhead\ (1.75\ GPM): 0.6 \times \left(1.75 \times 0.783 \times 0.72 \times 365 \times \frac{2.79}{1.68}\right) = 359$$

$$Showerhead\ (2.0\ GPM): 0.6 \times \left(2.0 \times 0.783 \times 0.72 \times 365 \times \frac{2.79}{1.68}\right) = 410$$

$$Showerhead\ (2.5\ GPM): 0.6 \times \left(2.5 \times 0.783 \times 0.72 \times 365 \times \frac{2.79}{1.68}\right) = 513$$

$$Tub\ Spout\ (5.0\ GPM): 0.4 \times \left(5.0 \times 0.783 \times 0.72 \times 365 \times \frac{2.79}{1.68}\right) = 683$$

Part 2: To determine baseline gallons of diverter leakage per year, the following formula was used:

$$Annual\ Diverter\ Waste = DLR \times t_S \times n_S \times 365\ \frac{days}{year} \times \frac{n_O}{n_{SH}}$$

Equation 107

Where:

DLR	=	*Diverter leakage rate (gpm) (see Table 2-418)*
t_S	=	*Shower time (min/shower) (see Table 2-418)*

Applying the formula to the values used for Texas from Table 2-418 returns the following values:

$$Diverter\ (0.8\ GPM): 0.8 \times 5.68 \times 0.72 \times 365 \times \frac{2.79}{1.68} = 1{,}983$$

Part 3: To determine gallons of water saved per year can be found by multiplying the total waste by the percent of hot water from Table 2-418.

$$Gallons\ of\ hot\ water\ saved = (SHBW + TSBW) \times HW\%_{SH,TS} + DW \times HW\%_{D}$$

Equation 108

Where:

SHBW = *Showerhead behavioral waste (gal)*

TSBW = *Tub spout behavioral waste (gal)*

DW = *Diverter waste (gal)*

$HW\%_{SH,TS}$ = *Showerheads and tub spout hot water percentage (see Table 2-418)*

$HW\%_{D}$ = *Diverter hot water percentage (see Table 2-418)*

Applying the formula to the values used for Texas from Table 2-418 returns the following values:

$$Total\ Annual\ Waste\ (1.5\ gpm): (308 + 683) \times 0.825 + 1{,}983 \times 0.737 = 2{,}279$$

$$Total\ Annual\ Waste\ (1.75\ gpm): (359 + 683) \times 0.825 + 1{,}983 \times 0.737 = 2{,}321$$

$$Total\ Annual\ Waste\ (2.0\ gpm): (410 + 683) \times 0.825 + 1{,}983 \times 0.737 = 2{,}363$$

$$Total\ Annual\ Waste\ (2.5\ gpm): (513 + 683) \times 0.825 + 1{,}983 \times 0.737 = 2{,}448$$

Table 2-418: Estimated Tub Spout/Showerhead System with TSRV Hot Water Usage Reduction

Description	Part 1- Behavioral Waste		Part 2—Diverter Leakage	Part 3—Total
	Showerhead Warm-up	Tub spout Warm-up		
Baseline showerhead flow rate (gpm)	1.5, 1.75, 2.0, or 2.5	N/A		
Tub spout flow rate (gpm)[276]	N/A	5.0	N/A	
Percent of warm up events[277]	60	40	N/A

277 Percent of warm up events from (Sherman 2014) Disaggregating Residential Shower Warm-Up Waste (Appendix B, Question 8).

Description	Part 1- Behavioral Waste		Part 2—Diverter Leakage	Part 3—Total
	Showerhead Warm-up	Tub spout Warm-up		
Average behavioral waste (minutes per shower)[278]	0.783	0.783	N/A	
Average diverter leak rate (gpm)[279]	N/A		0.80	N/A
Average shower time (minutes)[280]	N/A		5.68	N/A
Showers/person/day[281]	0.72	0.72	0.72	0.72
Occupants per home[282]	2.79	2.79	2.79	2.79
Showerheads per home[283]	1.68	1.68	1.68	1.68
Gallons behavioral waste per tub spout/showerhead per year (1.5 gpm)	308	683	1,983	2,974
Gallons behavioral waste per tub spout/showerhead per year (1.75 gpm)	359	683	1,983	3,025
Gallons behavioral waste per tub spout/showerhead per year (2.0 gpm)	410	683	1,983	3,076
Gallons behavioral waste per tub spout/showerhead per year (2.5 gpm)	513	683	1,983	3,179
Percent hot water[284]	82.5%	82.5%	73.7%	N/A
Gallons hot water saved per year (1.5 gpm)	N/A	N/A	N/A	2,279
Gallons hot water saved per year (1.75 gpm)	N/A	N/A	N/A	2,321
Gallons hot water saved per year (2.0 gpm)	N/A	N/A	N/A	2,363
Gallons hot water saved per year (2.5 gpm)	N/A	N/A	N/A	2,448

[278] Average behavioral waste from Lutz (2004) Feasibility Study and Roadmap to Improve Residential Hot Water Distribution Systems and Sherman (2014) Disaggregating Residential Shower Warm-Up Waste. Derived by dividing 47 seconds by 60 seconds.

[279] Average diverter leak rate from (Taitem 2011) Taitem Tech Tip – Leaking Shower Diverters.

[280] Average shower time from (REUWS 1999) Residential End Uses of Water Study and (Sherman 2015) Calculating Savings For: Auto-Diverting Tub Spout System with ShowerStart TSV.

[281] Derivation of value for showers per person per day defined in the Low Flow Showerhead measure.

[282] Occupants per home for Texas from US Census Bureau, Texas, "Persons per household, 2007-2011." Accessed January 2013 http://quickfacts.census.gov/qfd/states/48000.html.

[283] Showerheads per home assumed to be equal to the number of full bathrooms per home, taken from 2009 RECS, Table HC2.10.

[284] Average percent hot water for warm up events from (Lutz 2004) Feasibility Study and Roadmap to Improve Residential Hot Water Distribution Systems and (Sherman 2015) Calculating Savings For: Auto-Diverting Tub Spout System with ShowerStart TSV.

Energy Savings Algorithms

Energy savings for this measure are calculated as follows:

$$Energy\ Savings\ per\ TS\ System = \frac{\rho \times C_P \times V \times (T_{SetPoint} - T_{SupplyAverage})}{RE \times Conversion\ Factor}$$

Equation 109

Where:

ρ = *Water density, 8.33 lbs/gallon*

C_P = *Specific heat of water, 1 Btu/lb°F*

V = *Gallons of hot water saved per year per showerhead (see Table 2-418)*

$T_{SetPoint}$ = *Water heater setpoint: 120°F* [285]

T_{Supply} = *Average supply water temperature (see Table 2-419)*

RE = *Recovery Efficiency (or in the case of heat pump water heaters, COP). If unknown, use 0.98 as a default for electric resistance water heaters, 2.2 for heat pump water heaters, or 0.8 for gas hot water heaters.* [286]

$ConversionFactor$ = *3,412 Btu/kWh for electric or 100,000 Btu/therm for gas*

Demand Savings Algorithms

Demand savings will be calculated using the following formula:

$$Demand\ Savings\ per\ TS\ System = \frac{\rho \times C_P \times V \times (T_{SetPoint} - T_{SupplySeasonal})}{RE \times Conversion\ Factor} \times Ratio_{annual\ kWh}^{Peak_{seasonal} kW}$$

Equation 110

Where:

$T_{SupplySeasonal}$ = *Seasonal supply water temperature (see Table 2-419)*

[285] 120°F represents the assumed water heater setpoint. New York Department of Public Service recommends using water heater setpoint as a default value, see "New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs" October 2010, page 99. Data collection discussed in Appendix D of the EM&V team's Annual Statewide Portfolio Report for Program Year 2014-Volume 1, Project Number 40891 (August 2015), also supports a default value of 120°F.

[286] Default values based on median recovery efficiency of residential water heaters by fuel type in the AHRI database, at http://cafs.ahrinet.org/gama_cafs/sdpsearch/search.jsp?table=CWH.

$Ratio_{annual\ kWh}^{Peak_{seasonal}kW}$ = *Ratio of peak seasonal kW to annual kWh savings (see Table 2-420)*

Table 2-419: Water Mains Temperature

Climate Zone	Water Mains Temperature (°F)[287]		
	$T_{SupplyAverage}$	$T_{SupplySeasonal}$	
		Summer	Winter
Climate Zone 1: Panhandle	62.9	73.8	53.7
Climate Zone 2: North	71.8	84.0	60.6
Climate Zone 3: South	74.7	84.5	65.5
Climate Zone 4: Valley	77.2	86.1	68.5
Climate Zone 5: West	70.4	81.5	60.4

Table 2-420: Water Fixture Peak Demand Ratios

Peak Demand Ratios[288]	
Summer	Winter
0.000110	0.000274

The fixture peak demand ratios were derived by taking the fraction hot water use during the peak hour (summer: 4-5pm, winter: 7-8am) to the total daily usage from the Building America Performance Analysis Procedures for Existing Homes and dividing it by the number of days per year (365). The fraction of hot water use during the winter peak hour to total daily water usage is 0.1: $0.1/365 = 0.000274$. The summer peak hour to total daily water usage is 0.04: $0.04/365 = 0.000110$.

[287] Based on typical meteorological year (TMY) dataset for TMY3: http://rredc.nrel.gov/solar/old_data/nsrdb/1991-2005/tmy3/.

[288] US Department of Energy's "Building America Performance Analysis Procedures for Existing Homes" combined domestic hot water use profile (http://www.nrel.gov/docs/fy06osti/38238.pdf).

Deemed Energy Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Summer Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Deemed Winter Demand Savings Tables

There are no lookup tables available for this measure. See engineering algorithms in the previous section for calculating energy and demand savings.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) for this measure is established at 10 years.

This value is consistent with the EUL reported for a low-flow showerhead in the 2014 California Database for Energy Efficiency Resources (DEER).[289]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Recovery Efficiency (RE) or COP, if available
- Flow rate in gallons per minute (GPM) of showerhead installed
- Water heater type (e.g., heat pump, electric resistance)

2.5 RESIDENTIAL: APPLIANCES

2.5.1 ENERGY STAR® Ceiling Fans Measure Overview

TRM Measure ID: R-AP-CF

Market Sector: Residential

Measure Category: Appliances

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout, new construction

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This document presents the accepted deemed savings awarded for the installation of an ENERGY STAR® ceiling fan and light kit. Savings are awarded at a flat per unit rate, both for energy and demand savings. This measure will apply to existing homes and new construction.

Eligibility Criteria

This section is not applicable.

Baseline Condition

The baseline is a conventional non-ENERGY STAR® labeled ceiling fan and light kit.

High-Efficiency Condition

Table 2-422 displays the ENERGY STAR® requirements for eligible ceiling fans as of June 16, 2018. These values are subject to updates in ENERGY STAR® specifications; energy efficiency service providers are expected to comply with the latest ENERGY STAR® specification.[290]

[290] ENERGY STAR® Ceiling Fan Specification: https://www.energystar.gov/products/lighting_fans/ceiling_fans/ceiling_fans_key_product_criteria.

Table 2-422: ENERGY STAR® Ceiling Fan Definitions

Fan Type	Description
Ceiling fan	A non-portable device designed for home use that is suspended from the ceiling for circulating air via the rotation of fan blades; for which the lowest point on fan blades is greater than 10 inches from the ceiling.
Hugger ceiling fan	A ceiling fan for which the lowest point on the fan blades is less than or equal to 10 inches from the ceiling. Hugger ceiling fans can be safely installed on low ceilings and some are sold with ceiling fan light kits.

Table 2-423: ENERGY STAR® Ceiling Fan Efficiency Requirements

Type	Diameter (inches)	Minimum Efficiency (cfm/W)	Minimum High Speed Airflow (cfm)
Ceiling fan	$D \leq 36$	$\geq 0.72 \times D + 41.93$	$\geq 1{,}767$
	$36 < D < 78$	$\geq 2.63 \times D - 26.83$	$\geq 250 \times \pi \times (D/24)^2$
	$D \geq 78$		$\geq 8{,}296$
Hugger ceiling fan	$D \leq 36$	$\geq 0.31 \times D + 36.84$	$\geq 1{,}414$
	$36 < D < 78$	$\geq 1.75 \times D - 15$	$\geq 200 \times \pi \times (D/24)^2$
	$D \geq 78$		$\geq 6{,}637$

Table 2-424: ENERGY STAR® Ceiling Fan Light Kit Efficacy Requirements

Type	Minimum Efficacy (lumens/W)	Minimum Light Output (lumens)
Shipped with ENERGY STAR certified light bulbs	65.0	N/A
Separable light source	65.0	800
Integrated light source	70.0	

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Energy Savings Algorithms

Energy savings were calculated using the ENERGY STAR® Ceiling Fan Savings Calculator found on the ENERGY STAR® website.[291] Default values were taken directly from the ENERGY STAR® Ceiling Fan Savings Calculator, unless otherwise specified.

[291] ENERGY STAR® Ceiling Fan Savings Calculator (updated September 2013). https://www.energystar.gov/buildings/facility-owners-and-managers/existing-buildings/save-energy/purchase-energy-saving-products.

$$kWh_{savings} = (kWh_{baseline} - kWh_{ES})_{fan} + (kWh_{baseline} - kWh_{ES})_{lgt} \times IEF_E$$

Equation 111

$$kWh_{baseline,Fan} = \frac{W_{Fan,baseline} \times AOH_{Fan}}{1{,}000}$$

Equation 112

$$kWh_{ES,Fan} = \frac{W_{Fan,ES} \times AOH_{Fan}}{1{,}000}$$

Equation 113

$$W_{Fan} = (W_{LS} \times OP_{LS}) + (W_{MS} \times OP_{MS}) + (W_{HS} \times OP_{HS})$$

Equation 114

$$kWh_{baseline,Lgt} = \frac{W_{Lgt,baseline} \times AOH_{Lgt}}{1{,}000}$$

Equation 115

$$kWh_{ES,Lgt} = \frac{W_{Lgt,ES} \times AOH_{Lgt}}{1{,}000}$$

Equation 116

Where:

$kWh_{baseline}$	=	*Non-ENERGY STAR® baseline energy usage*
kWh_{ES}	=	*ENERGY STAR® average energy usage*
IEF_E	=	*Energy Interactive Effects Factor (Table 2-425)* [292]
$W_{Lgt,baseline}$	=	*Conventional lighting total wattage = 115 W (160 W default value from ENERGY STAR® calculator reduced to comply with EISA 2007 baseline wattages)*[293]
$W_{Lgt,ES}$	=	*Actual wattage of installed ENERGY STAR® lighting; if unknown, assume one high-efficiency 32 W lamp*
$W_{Fan,baseline}$	=	*Conventional fan motor wattage*
$W_{Fan,ES}$	=	*ENERGY STAR® fan motor wattage*
$W_{LS,MS,HS}$	=	*Fan motor wattage at low, medium, and high speed; see Table 2-426*

[292] The assumed energy interactive effects factors are taken from the residential lighting measure.
[293] Assumes a mix of 40 and 60 W incandescent lamps. EISA 2007 baseline wattages are approximately 72 percent of standard incandescent wattages.

$OP_{LS,MS,HS}$ = *Fan operating percentage at low, medium, and high speed; see Table 2-427*

AOH_{Lgt} = *Annual lighting operating hours = 803 hours/year (assuming 2.2 hours/day and 365 days/year operation)[294]*

AOH_{Fan} = *Annual fan operating hours = 1,095 hours/year (assuming 3.0 hours/day and 365 days/year operation)*

$1{,}000$ = *Constant to convert from W to kW*

Table 2-425: ENERGY STAR® Ceiling Fans—Interactive Effects Factor for Cooling Energy Savings and Heating Energy Penalties[295]

IEF_E					
Heating/Cooling Type*	**Climate Zone 1**	**Climate Zone 2**	**Climate Zone 3**	**Climate Zone 4**	**Climate Zone 5**
Gas Heat with AC	1.06	1.13	1.17	1.15	1.12
Gas Heat with no AC	1.00	1.00	1.00	1.00	1.00
Heat Pump	0.91	1.00	1.05	1.11	0.97
Electric Resistance Heat with AC	0.65	0.80	0.90	1.00	0.75
Electric Resistance Heat with no AC	0.57	0.69	0.76	0.83	0.65
No heat with AC	1.06	1.13	1.17	1.15	1.12
Unconditioned Space	1.00	1.00	1.00	1.00	1.00
Heating/Cooling Unknown[296,297]	0.88	0.98	1.04	1.07	0.95

* IEF for homes with no AC are most appropriate for customers with evaporative cooling or room air conditioners.

294 The assumed annual operating hours are taken from the residential lighting measure.

295 Extracted from BEopt energy models used to estimate savings for envelope measures. Referencing the EISA baseline table, the typical lumen output was determined by taking the midpoint for the 60-watt equivalent lamp (900 lm), which was assumed to be the most typical installation. The resulting lumens were divided by the default wattage for incandescents (43 W), CFLs (13 W), and LEDs (10 W) resulting in an assumed efficacy for incandescents (21 lm/W), CFLs (70 lm/W), and LEDs (90 lm/W). IEF values were calculated using the following formula: $1 + HVAC_{savings}/Lighting_{savings}$.

296 Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

297 Also applies to upstream lighting.

Table 2-426: Ceiling Fan Motor Wattages

Fan Type	Fan Speed	Fan Motor Wattage (W)
Conventional	Low	15
	Medium	34
	High	67
ENERGY STAR®	Low	6
	Medium	23
	High	56

Table 2-427: Ceiling Fan Operating Percentages

Fan Speed	Operating Percentage (OP)
Low	40%
Medium	40%
High	20%

Demand Savings Algorithms

Peak demand savings were calculated using separate coincidence factors for the lighting and the fan motor portion of the ceiling fan savings. For lighting the coincidence factor varies based on climate zone. For the fan motor a coincidence factor of 0.446 was applied (derived from the EnergyGauge software ceiling fan profiles).

$$kW_{savings} = kW_{Fan} + kW_{Lgt}$$

Equation 117

$$kW_{Fan} = \frac{W_{Fan,baseline} - W_{Fan,ES}}{1{,}000} \times CF_{Fan}$$

Equation 118

$$kW_{Lgt} = \frac{W_{Lgt,baseline} - W_{Lgt,ES}}{1{,}000} \times CF_{Lgt} \times IEF_D$$

Equation 119

Where:

kW_{Fan} = *Fan demand savings*

CF_{Fan} = *Fan motor coincidence factor = 0.446*

kW_{Lgt} = *Lighting demand savings*

CF_{Lgt} = *Lighting coincidence factor (Table 2-428)*

IEF_D = *Demand Interactive Effects Factor (Table 2-429)*[298]

Table 2-428 ENERGY STAR® Ceiling Fans—Lighting Coincidence Factors[299]

[303] Calculated using IEFs from Cadmus report, weighted using TMY CDD and HDD for Texas, and adjusted to exclude 16 percent outdoor lighting except for upstream defaults. Cadmus report: Cadmus. Entergy Energy-Efficiency Portfolio Evaluation Report 2013 Program Year. Prepared for Entergy Arkansas, Inc. March 14, 2014. Docket No. 07-082-TF.

[304] Also applies to upstream lighting.

Measure Life and Lifetime Savings

The estimated useful life (EUL) is established at 10 years according to the ENERGY STAR® Ceiling Fan Savings Calculator.

This EUL is consistent with Docket No. 38025 approved in 2010.[305]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- The number of installed ENERGY STAR® ceiling fan and light kits.
- Wattage of installed lighting

2.5.2 ENERGY STAR® Clothes Washers Measure Overview

TRM Measure ID: R-AP-CW

Market Sector: Residential

Measure Category: Appliances

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout, new construction

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look up-tables

Savings Methodology: Engineering algorithms and estimates

Measure Description

This document presents the accepted deemed savings awarded for the installation of an ENERGY STAR® clothes washer. Savings are awarded at a flat per unit rate, both for energy and demand savings. This measure will apply to existing homes and new construction.

These deemed savings are calculated using the federal standards effective January 1, 2018.

Eligibility Criteria

This section is not applicable.

Baseline Condition

Effective January 1, 2018, the baseline is the Department of Energy (DOE) minimum efficiency standard[306] for top-loading clothes washers. While the DOE provides criteria for both top- and front-loading washers, only the standards for top-loading washers are listed below, as a top-loading unit is assumed to be the baseline equipment. This approach is consistent with the ENERGY STAR® appliance calculator.

[306] DOE minimum efficiency standard for residential clothes washers. https://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/39.

Table 2-431: Federal Standard for Clothes Washers

Product Type	Current Criteria as of January 1, 2018
Top-loading, Standard (1.6 ft^3 or greater capacity)	IMEF ≥ 1.57 IWF≤ 6.5
Top-loading, Compact (less than 1.6 ft^3 capacity)	IMEF ≥ 1.15 IWF≤ 12.0

High-Efficiency Condition

The table below displays the ENERGY STAR® Final Version 8.0 requirements for eligible clothes washers effective February 5, 2018, with early certification available starting May 5, 2017.[307] These values are subject to updates in ENERGY STAR® specifications; energy efficiency service providers are expected to comply with the latest ENERGY STAR® requirements.

Table 2-432: ENERGY STAR® Specifications for Residential Clothes Washers

Product Type	Current Criteria as of February 5, 2018
ENERGY STAR® Residential Front-loading (> 2.5 ft^3)	IMEF ≥ 2.76 IWF≤ 3.2
ENERGY STAR® Residential Top-loading (> 2.5 ft^3)	IMEF ≥ 2.06 IWF ≤ 4.3
ENERGY STAR® Residential Small or Compact (< 2.5 ft^3)	IMEF ≥ 2.07 IWF ≤ 4.2

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Energy Savings Algorithms

Energy savings for this measure were derived using the ENERGY STAR® Appliance Savings Calculator found on the ENERGY STAR® website.[308] This document will be updated regularly to apply the values provided in the latest available ENERGY STAR® appliance calculator. The most recent TRM version should be referenced to determine the savings for this measure.

[307] Available for download at: http://www.energystar.gov/sites/default/files/specs//ENERGY%20STAR%20Final%20Version%207.0%20Clothes%20Washer%20Program%20Requirements.pdf.

Claimed Peak Demand Savings

Refer to Volume 1, Appendix B: Peak Demand Reduction Documentation for further details on peak demand savings and methodology.

Additional Calculators and Tools

This section is not applicable.

Measure Life and Lifetime Savings

The estimated useful life (EUL) of an ENERGY STAR® clothes washer is established at 11 years based on the Technical Support Document for the current DOE Final Rule standards for residential clothes washers.[314]

[314] The median lifetime was calculated using the survival function outlined in the DOE Technical Support Document. Final Rule: Standards, Federal Register, 77 FR 32308 (May 31, 2012) and associated Technical Support Document. Accessed 10/07/2014. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/39. Download TSD at: http://www.regulations.gov/#!documentDetail;D=EERE-2008-BT-STD-0019-0047.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Number of units installed
- Type of unit (top-loading, front-loading, or compact)
- Fuel type of water heater (gas or electric)
- Fuel type of dryer (gas or electric)

2.5.3 ENERGY STAR® Dishwashers Measure Overview

TRM Measure ID: R-AP-DW

Market Sector: Residential

Measure Category: Appliances

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout, new construction

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look up-tables

Savings Methodology: Engineering algorithms and estimates

Measure Description

This document presents the accepted deemed savings awarded for the installation of an ENERGY STAR® dishwasher. Savings are awarded at a flat per unit rate, both for energy and demand savings. This measure will apply to existing homes and new construction.

Eligibility Criteria

This measure applies to both standard and compact dishwasher types.

Baseline Condition

Effective May 30, 2013, the baseline is the Department of Energy (DOE) minimum efficiency standard[315] for dishwashers.

[315] DOE minimum efficiency standard for residential dishwashers. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/67.

Table 2-439 Federal Standard for Dishwashers

Product Type	Estimated Annual Energy Use (kWh/year)	Water Consumption (gallons/cycle)
Standard (≥ 8 place settings)	≤ 307	≤ 5.0
Compact (< 8 place settings)	≤ 222	≤ 3.5

High-Efficiency Condition

The following table displays the ENERGY STAR® Final Version 6.0 requirements for eligible dishwashers effective January 29, 2016.[316] These values are subject to updates in ENERGY STAR® specifications; energy efficiency service providers are expected to comply with the latest ENERGY STAR® requirements.

Table 2-440 ENERGY STAR® Specifications for Dishwashers

Product Type	Estimated Annual Energy Use (kWh/year)	Water Consumption (gallons/cycle)
Standard (≥ 8 place settings + 6 serving pieces)	≤ 270	≤ 3.5
Compact (< 8 place settings + 6 serving pieces)	≤ 203	≤ 3.1

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Energy Savings Algorithms

Energy savings for this measure were derived using the ENERGY STAR® Appliance Savings Calculator found on the ENERGY STAR® website and the revised ENERGY STAR® specification in Table 2-440.[317] Default values were taken directly from the ENERGY STAR® calculator. This document will be updated regularly to apply the values provided in the latest available ENERGY STAR® specification and appliance calculator. The most recent TRM version should be referenced to determine measure savings for this measure.

Measure Life and Lifetime Savings

The estimated useful life (EUL) is established at 15 years based on the Technical Support Document for the current DOE Final Rule standards for residential dishwashers.[320]

[320] The median lifetime was calculated using the survival function outlined in the DOE Technical Support Document. Final Rule: Standards, Federal Register, 77 FR 31918 (May 30, 2012) and associated Technical Support Document. Accessed 10/07/2014. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/67. Download TSD at: http://www.regulations.gov/#!documentDetail;D=EERE-2011-BT-STD-0060-0007.

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Number of units installed
- Type of dishwasher (standard or compact)
- Fuel type of water heater (gas or electric)

References and Efficiency Standards

Petitions and Rulings

2.5.4 ENERGY STAR® Refrigerators Measure Overview

TRM Measure ID: R-AP-RF

Market Sector: Residential

Measure Category: Appliances

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout, new construction, early retirement

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure applies to all ENERGY STAR® refrigerators that meet the criteria for the ENERGY STAR® label specified below.

Eligibility Criteria

To qualify for early retirement, the ENERGY STAR® unit must replace an existing, full-size unit with a maximum age of 20 years. To determine the remaining useful life of an existing unit, see Table 2-449. All retired refrigerators must be dismantled in an environmentally safe manner in accordance with applicable federal, state, and local regulations. The installer will provide documentation of proper disposal of refrigerators. In order to receive early retirement savings, the unit to be replaced must be functioning at the time of removal.

Newly-installed refrigerators must meet current ENERGY STAR® efficiency levels.

Baseline Condition

For new construction or replace-on-burnout, the baseline is the Department of Energy (DOE) minimum efficiency standard[321] for refrigerators, effective September 15, 2014.

[321] DOE minimum efficiency standard for residential refrigerators and freezers. http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/43.

For early retirement, the baseline for refrigerators is assumed to be the annual unit energy consumption of the refrigerator being replaced, as reported by the Midwest Energy Performance Analytics Refrigerator and Freezer Energy Rating Database.[322].

Alternatively, the baseline annual energy usage of the refrigerator being replaced may be estimated by metering for a period of at least two hours using the measurement protocol specified in the DOE report, "Incorporating Refrigerator Replacement into the Weatherization Assistance Program".[323]

To determine annual kWh of the refrigerator being replaced, use the following formula:

$$Annual\ kWh\ Usage = \frac{WH \times 8{,}760}{h \times 1{,}000}$$

Equation 142

Where:

WH = *Watt-hours metered during a time period*

h = *Measurement time period (hours)*

8,760 = *Hours in a year*

1,000 Watt-hours = *1 kWh*

High-Efficiency Condition

Table 2-446 displays the ENERGY STAR® requirements for eligible refrigerators, which went into effect September 15, 2014. These values are subject to updates in ENERGY STAR® specifications; energy efficiency service providers are expected to comply with the latest ENERGY STAR® requirements.

Table 2-446: ENERGY STAR® Specifications for Refrigerators

ENERGY STAR® Refrigerator		
Product Type	**Volume**	**Criteria as of September 15. 2014**
Full-Size Refrigerators and Refrigerator-Freezers	7.75 cubic feet or greater	Approximately 10 percent more energy efficient than the minimum federal standard (see Table 2-447)

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

New Construction or Replace-on-Burnout

Energy Savings Algorithms

$$kWh_{savings} = kWh_{baseline} - kWh_{ES}$$

Equation 143

Where:

$kWh_{baseline}$ = *Federal standard baseline energy usage (see Table 2-447)*

kWh_{ES} = *ENERGY STAR average energy usage (see (see Table 2-447)*

Demand Savings Algorithms

$$kW_{savings} = \frac{kWh_{savings}}{8{,}760\ hrs} \times LSAF$$

Equation 144

Where:

LSAF = *Load Shape Adjustment Factor (see Table 2-448)*

Table 2-448: ENERGY STAR® Refrigerator Load Shape Adjustment Factors[331]

Season	Climate Zone 1: Amarillo	Climate Zone 2: Dallas	Climate Zone 3: Houston	Climate Zone 4: Corpus Christi	Climate Zone 5: El Paso
Summer	1.112	1.099	1.108	1.100	1.081
Winter	0.929	0.966	0.924	0.941	0.966

Early Retirement

Annual energy (kWh) and peak demand (kW) savings must be calculated separately for two time periods:

1. The estimated remaining life of the equipment that is being removed, designated the remaining useful life (RUL), and
2. The remaining time in the EUL period (16—RUL)

[331] See Volume 1, Appendix B.

Annual energy and peak demand savings are calculated by weighting the early retirement and replace-on-burnout savings by the RUL of the unit and the remainder of the EUL period, as outlined in the Volume 3 appendices.

Where:

RUL = *Remaining Useful Life (see Table 2-449); if unknown, assume the age of the replaced unit is equal to the EUL resulting in a default RUL of 5.0 years*

EUL = *Estimated Useful Life = 16 years*

Table 2-449: Remaining Useful Life (RUL). of Replaced Refrigerator

Age of Replaced Refrigerator (years)	RUL (years)	Age of Replaced Refrigerator (years)	RUL (years)
1	15.2	12	7.0
2	14.2	13	6.6
3	13.2	14	6.3
4	12.2	15	6.0
5	11.2	16	5.0
6	10.3	17	4.0
7	9.6	18	3.0
8	8.9	19	2.0
9	8.3	20	1.0
10	7.8	21[332,333]	0.0
11	7.4		

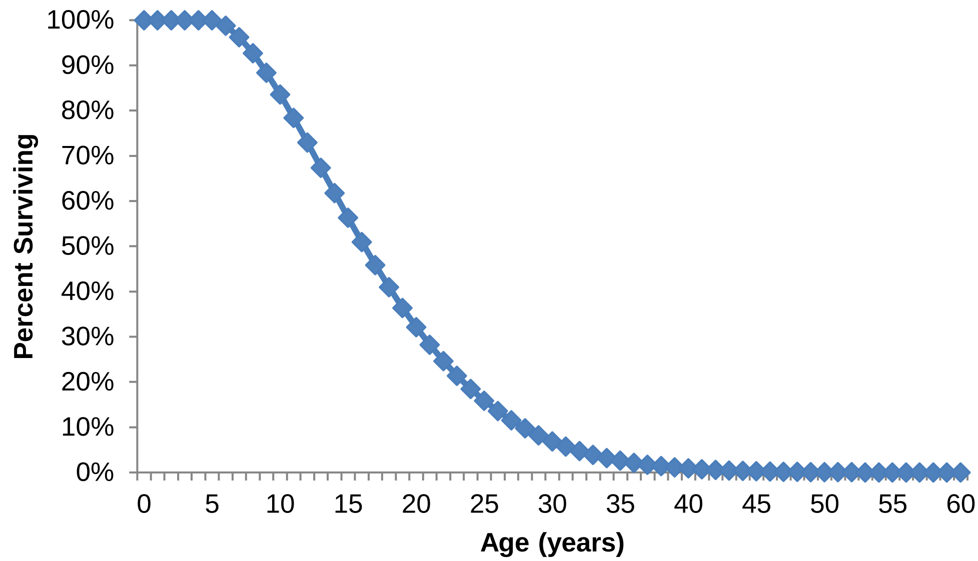
Derivation of RULs

ENERGY STAR® refrigerators have an estimated useful life of 16 years. This estimate is consistent with the age at which approximately 50 percent of the refrigerators installed in a given year will no longer be in service, as described by the survival function in Figure 2-10.

332 RULs are capped at the 75th percentile of equipment age, 21 years, as determined based on DOE survival curves (see Figure 2-10). Systems older than 21 years should use the ROB baseline. See the January 2015 memo, "Considerations for early replacement of residential equipment," for further detail.

333 Ward, B., Bodington, N., Farah, H., Reeves, S., and Lee, L. "Considerations for early replacement of residential equipment." Prepared by the Evaluation, Measurement, and Verification (EM&V) team for the Electric Utility Marketing Managers of Texas (EUMMOT). January 2015. This document has been made available to all Texas investor-owned utilities through the EM&V team's SharePoint.

Figure 2-10: Survival Function for ENERGY STAR® Refrigerators[334]



The method for estimating the remaining useful life (RUL). of a replaced system uses the age of the existing system to re-estimate the projected unit lifetime based on the survival function shown in Figure 2-10. The age of the refrigerator being replaced is found on the horizontal axis, and the corresponding percentage of surviving refrigerators is determined from the chart. The surviving percentage value is then divided in half, creating a new estimated useful lifetime applicable to the current unit age. Then, the age (year) that corresponds to this new percentage is read from the chart. RUL is estimated as the difference between that age and the current age of the system being replaced.

For example, assume a refrigerator being replaced is 15 years old. The corresponding percent surviving value is 56 percent. Half of 56 percent is 28 percent. The age corresponding to 28 percent on the chart is 21 years. Therefore, the RUL of the refrigerator being replaced is (21–15) = 6 years.

Energy Savings Algorithms

For the RUL time period:

$$kWh_{savings,ER} = kWh_{manf} - kWh_{ES}$$

Equation 145

For The remaining time in the EUL period., calculate annual savings as you would for a replace-on-burnout project:

[334] Department of Energy, Federal Register, 76 Final Rule 57516, Technical Support Document: 8.2.3.1 Estimated Survival Function. September 15, 2011. http://www1.eere.energy.gov/buildings/appliance_standards/pdfs/refrig_finalrule_tsd.pdf.

$$kWh_{savings,ROB} = kWh_{baseline} - kWh_{ES}$$

Equation 146

Where:

kWh_{manf}	=	*Annual unit energy consumption from the Association of Home Appliance Manufacturers (AHAM) refrigerator database[335] (or from metering)*
$kWh_{baseline}$	=	*Federal standard baseline energy usage (see Table 2-447)*
kWh_{ES}	=	*ENERGY STAR® average energy usage (see Table 2-447)*

Demand Savings Algorithms

To calculate demand savings for the early retirement of a refrigerator, a similar methodology is used as for replace-on-burnout installations, with separate savings calculated for the remaining useful life of the unit, and the remainder of the EUL as outlined in the section above.

For the RUL time period:

$$kW_{savings,ER} = \frac{kWh_{savings,ER}}{8{,}760\ hrs} \times LSAF$$

Equation 147

For The remaining time in the EUL period., calculate annual savings as you would for a replace-on-burnout project:

$$kW_{savings,ROB} = \frac{kWh_{savings,ROB}}{8{,}760\ hrs} \times LSAF$$

Equation 148

Where:

LSAF	=	*Load Shape Adjustment Factor (Table 2-448)*

Annual deemed summer peak demand savings are calculated by weighting the early retirement and replace-on-burnout savings by the RUL of the unit and the remainder of the EUL period, as outlined in the Volume 3 appendices.

[335] AHAM Refrigerator Database. http://rfdirectory.aham.org/AdvancedSearch.aspx.

Where:

RUL	=	*Remaining Useful Life (see Table 2-449)*
EUL	=	*Estimated Useful Life = 16 years*[336]

Document Revision History

Table 2-450: Residential ENERGY STAR® Refrigerators Revision History

TRM Version	Date	Description of Change
v1.0	11/25/2013	TRM v1.0 origin
v2.0	4/18/2014	TRM v2.0 update. Low-income and Hard-to-Reach Market Transformation section merged with main measure as "Early Retirement" option. Updated by Frontier Associates, March 2014, based on new federal standards.
v2.1	1/30/2015	TRM v2.1 update. New ENERGY STAR® standards incorporated.
v3.0	4/10/2015	TRM v3.0 update. Early retirement savings may be claimed through any appropriately designed program in accordance with EM&V team's memo, "Considerations for early replacement of residential equipment." Remaining useful lifetimes updated. LSAF updated to align with new peak demand methodology.
v3.1	11/05/2015	TRM v3.1 update. Correction to legacy LSAF. Revision to align with ENERGY STAR® calculator and specification.
v3.1	3/28/2016	TRM v3.1 March revision. Updated summer and winter coincidence factors.
v4.0	10/10/2016	TRM v4.0 update. Updated RUL value for units with the age of seven years and added RUL values for units with an age of one to five years. Added a default RUL value for when the age of the unit is unknown. Eliminated the eligibility requirement of the existing unit to have an age of minimum five years.
v5.0	10/2017	TRM v5.0 update. No revision.
v6.0	11/2018	TRM v6.0 update. Updated database reference.

2.5.5 ENERGY STAR® Pool Pumps Measure Overview

TRM Measure ID: R-AP-PP

Market Sector: Residential

Measure Category: Appliances

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Replace-on-burnout, new construction, early retirement

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Look-up tables

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure involves the replacement of a single-speed pool pump with an ENERGY STAR® certified variable speed or multi-speed pool pump.

Eligibility Criteria

This measure applies to all residential applications of in-ground pools. Above ground pools and pools that serve multiple tenants in a common area are not eligible for this measure.

Multi-speed pool pumps are an alternative to variable speed pumps. The multi-speed pump uses an induction motor that functions as two motors in one, with full-speed and half-speed options. Multi-speed pumps may enable significant energy savings. However, if the half-speed motor is unable to complete the required water circulation task, the larger motor will operate exclusively. Having only two speed-choices limits the ability of the pump motor to fine-tune the flow rates required for maximum energy savings.[338] Therefore, multi-speed pumps must have a high-speed override capability to revert back to low speed after a period not to exceed 24 hours.

Baseline Condition

The baseline condition is a 1-3 horsepower (HP) standard efficiency single-speed pool pump.

---

338 Hunt, A. and Easley, S., 2012, "*Measure Guideline: Replacing Single-Speed Pool Pumps with Variable Speed Pumps for Energy Savings.*" Building America Retrofit Alliance (BARA), U.S. U.S. DOE. May/. http://www.nrel.gov/docs/fy12osti/54242.pdf.

High-Efficiency Condition

The high efficiency condition is a 1-3 HP ENERGY STAR® certified variable speed pump (VSP) or ENERGY STAR® certified multi speed pool pump.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Energy Savings Algorithms

Energy savings for this measure were derived using the ENERGY STAR® Pool Pump Savings Calculator with Texas selected as the applicable location so Texas-specific assumptions were used.[339]

$$kWh_{Savings} = kWh_{conv} - kWh_{ES}$$

Equation 149

Where:

kWh_{conv}= Conventional single-speed pool pump energy (kWh)

kWh_{ES}= ENERGY STAR® variable speed pool pump energy (kWh)

Algorithms to calculate the above parameters are defined as:

$$kWh_{conv} = \frac{PFR_{conv} \times 60 \times hours_{conv} \times days}{EF_{conv} \times 1000}$$

Equation 150

$$kWh_{ES} = kWh_{HS} + kWh_{LS}$$

Equation 151

$$kWh_{HS} = \frac{PFR_{HS} \times 60 \times hours_{HS} \times days}{EF_{HS} \times 1000}$$

Equation 152

$$kWh_{LS} = \frac{PFR_{LS} \times 60 \times hours_{LS} \times days}{EF_{LS} \times 1000}$$

Equation 153

[339] The ENERGY STAR® Pool Pump Savings Calculator, updated February 2013, can be found on the ENERGY STAR® website at: https://www.energystar.gov/products/certified-products/detail/pool-pumps.

Where:

kWh_{HS}	=	*ENERGY STAR® variable speed pool pump energy at high speed [kWh]*
kWh_{LS}	=	*ENERGY STAR® variable speed pool pump energy at low speed [kWh]*
$hours_{conv}$	=	*Conventional single-speed pump daily operating hours (Table 2-452)*
$hours_{HS}$	=	*ENERGY STAR® variable speed pump high speed daily operating hours (Table 2-452)*
$hours_{LS}$	=	*ENERGY STAR® variable speed pump low speed daily operating hours (Table 2-452)*
days	=	*Operating days per year = 365 days (default)*
PFRconv	=	*Conventional single-speed pump flow rate [gal/min] (Table 2-451)*

Additional Calculators and Tools

ENERGY STAR® Pool Pump Savings Calculator, updated February 2013, can be found on the ENERGY STAR® website at: https://www.energystar.gov/products/certified-products/detail/pool-pumps.

Measure Life and Lifetime Savings

According to DEER 2014, the estimated useful life for this measure is 10 years.[346]

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

For All Projects:

- Rated horsepower of new pool pump
    - Climate zone
    - Proof of purchase including quantity, make and model information

[346] Database for Energy Efficient Resources (2014). http://www.deeresources.com/.

For a Significant Sample of Projects where attainable (e.g. those projects that are selected for inspection, not midstream or retail programs):

- Items listed for All Projects above
- Decision/Action Type: Early Retirement, Replace-On-Burnout, or New Construction
- Rated horsepower of existing pool pump
    - Existing and new pool pump operating hours

2.6 RESIDENTIAL: APPLIANCE RECYCLING

2.6.1 Refrigerator/Freezer Recycling Measure Overview

TRM Measure ID: R-AP-RR

Market Sector: Residential

Measure Category: Appliance Recycling

Applicable Building Types: Single-family, duplex and triplex; multifamily; manufactured

Fuels Affected: Electricity

Decision/Action Type(s): Early retirement

Program Delivery Type(s): Prescriptive

Deemed Savings Type: Deemed savings calculation

Savings Methodology: Engineering algorithms and estimates

Measure Description

This measure involves early retirement and recycling of an existing, full-size (7.75 ft^3 or greater) refrigerator/freezer in a residential application. Savings represent the entire estimated energy consumption of the existing unit and are applicable over the estimated remaining life of the existing unit.

Eligibility Criteria

This measure applies to operable primary and secondary retired refrigerators/freezers. Recycling savings for this measure are limited to the removal of a working refrigerator/freezer from the electrical grid and differ from the savings specified in the ENERGY STAR® Refrigerator replacement measure. The latter, which pertain to the direct replacement of a refrigerator and reflect the difference in energy consumption between new ENERGY STAR® qualifying and standard efficiency models, may be claimed for the recycling of primary refrigerators/freezers that have been replaced if savings for that replacement were not already claimed in another energy efficiency program. To qualify, the customer must release the existing unit to the utility or utility representative to ensure proper disposal in accordance with applicable federal, state, and local regulations.

Baseline Condition

Without program intervention, the recycled refrigerator or freezer would have remained operable on the electrical grid. As a result, the baseline condition for early retirement programs is the status quo (continued operation) and the basis for estimating energy savings is the annual energy consumption of the refrigerator or freezer being retired (as specified in the "Energy and Demand Savings Methodology" section).

<u>High-Efficiency Condition</u>

There is no efficiency standard for a recycling measure because the energy efficient action is the removal of an operable appliance, not—as with most demand side management programs—the installation of a higher efficiency model.

Energy and Demand Savings Methodology

Savings Algorithms and Input Variables

Energy Savings

Energy savings are calculated as follows:

$$\begin{aligned} &\boldsymbol{kWh_{savings} = kWh_{existing} \times ISAF \times PUF} \\ &\boldsymbol{= 1{,}308 \times 0.942 \times 0.915} \\ &\boldsymbol{= 1{,}128\ kWh} \end{aligned}$$

Equation 155

Where:

$kWh_{existing}$ = *Average annual energy consumption*[347] *= 1,308 kWh*

$ISAF$ = *In Situ Adjustment Factor*[348] *= 0.942*

PUF = *Part Use Factor*[349] *= 0.915*

Demand Savings

Summer peak demand savings are calculated as follows:

$$kW_{savings=}\frac{kWh_{savings}}{AOH} \times LSAF$$

Equation 156

Program Tracking Data and Evaluation Requirements

Primary inputs and contextual data that should be specified and tracked by the program database to inform the evaluation and apply the savings properly are:

- Climate zone
- Number of refrigerators/freezers replaced
- Age of removed unit
- Size (in cubic feet)
- Configuration (top freezer, bottom freezer, side-by-side, or single-door)
